Coordination Opportunity Report

Georgia Power

Plant McIntosh Upgrades

Distance between closest known points: 24.74 km

Dominion Energy South Carolina

Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in

PROJECTS

Project A: Plant McIntosh Upgrades, associated with Georgia Power filings.

Project B: Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in, with an unspecified utility company in South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are 24.74 km apart. This places them in the under 40 km category, where regional construction coordination and shared mobilization may be viable.

GEOGRAPHIC ANALYSIS

At a distance of 24.74 km, direct site sharing, shared access roads, or common laydown yards are not practical. However, this proximity across the Georgia-South Carolina border region is close enough that the utilities could potentially coordinate regional contractor resources, heavy transport, or specialized equipment mobilization across neighboring service territories.

TIMELINE ANALYSIS

Project B is currently in progress with an estimated completion date of December 31, 2026, though its start date is not specified. Project A is approved, but both start and completion dates are null in the provided data. Because schedule information for Project A is missing, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Regional contractor sharing: The projects could potentially utilize common specialized high-voltage or civil contractors working in the Savannah and Lowcountry region.
- Equipment mobilization: Specialized equipment, such as heavy-lift cranes or heavy-haul transport, may be shared sequentially if construction windows align.
- Outage timing coordination: If interconnecting transmission lines or grid interfaces are affected by both the McIntosh generation addition and the Okatie 230 kV fold-in, regional transmission planners may be able to

align planned outages to protect system reliability.

- Regional construction scheduling: Project teams could coordinate work schedules to avoid competing for limited local craft labor.

POTENTIAL BENEFITS

- Reduced mobilization and demobilization expenses if specialized contractors or equipment can serve both regional sites.
- Minimized regional grid disruption through proactive alignment of transmission outages.
- Improved labor and material availability through regional communication.

RISKS AND LIMITATIONS

- Incomplete timeline data: The lack of schedule details for Project A makes it impossible to verify whether active construction windows will overlap.
- Scope divergence: Project A involves natural gas power plant generation expansion, while Project B focuses on substation expansion and transmission line fold-in work.
- Jurisdictional boundaries: The projects are located in different states (Georgia and South Carolina) and are managed by different entities, which could complicate formal cooperation or joint procurement.
- Distance limitations: At 24.74 km, immediate physical site synergy is not feasible.

FINAL ASSESSMENT

LOW

While the distance of 24.74 km makes regional cooperation theoretically possible, the disparate project scopes, separate state jurisdictions, and lack of timeline data for Project A indicate that only limited, indirect coordination is realistic at this stage.

RECOMMENDED NEXT STEP

Project managers should conduct an initial information-sharing call to verify the construction schedule for Plant McIntosh and identify any potential transmission outage conflicts prior to Project B's late-2026 completion target.
