

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant McIntosh Upgrades

Distance between closest known points: 12.58 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

- Project A: Plant McIntosh Upgrades, Georgia Power (Georgia).
- Project B: Jasper - Okatie 230 kV #2: Construct (South Carolina).

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between these two projects are 12.58 km apart, placing them in GridAlign's under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 12.58 km across the Georgia and South Carolina border area, the projects are not touching or adjacent. This distance rules out shared access roads, direct right-of-way sharing, or adjacent laydown yards. However, being under 40 km apart, the sites are within a common regional work zone where utilities could potentially share regional contractors, crews, or mobilization resources.

TIMELINE ANALYSIS

Project B is currently in progress with an estimated completion date of 12/01/2026, though its start date is not specified. Project A is approved, but its start date, end date, and construction duration are null. Because project schedule data for Plant McIntosh is missing, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Specialized contractor sharing: If construction schedules overlap, both projects could potentially utilize the same regional electrical, structural, or heavy civil contractors.
- Equipment and crane mobilization: Heavy machinery, such as large mobile cranes or heavy hauling equipment, could potentially be shared or sequenced to minimize mobilization trips to the region.
- Regional outage and transmission planning: If plant integration or line construction requires regional transmission outages, operators could coordinate outage scheduling to avoid concurrent grid disruptions.

POTENTIAL BENEFITS

- Decreased mobilization expenses through coordinated contractor and heavy equipment scheduling.
- Improved regional crew and vendor availability by aligning procurement across nearby utilities.
- Mitigated electrical reliability risks by coordinating regional transmission outages.

RISKS AND LIMITATIONS

- Project A lacks schedule dates, making it impossible to verify whether field activities will coincide.
- The scopes of work are substantially different; Project A is a natural gas plant expansion, while Project B is a 230 kV transmission line and CIP hut construction.
- The projects are located in different states (Georgia and South Carolina) under potentially different utility operators, which may create administrative hurdles for cross-utility coordination.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible through shared regional contractors, equipment mobilization, and regional grid planning, but important uncertainty remains regarding Project A's construction timeline and differing operating jurisdictions.

RECOMMENDED NEXT STEP

Utility planners should initiate contact with the Plant McIntosh project team to determine its planned construction timeline and identify potential schedule overlap with the Jasper - Okatie project.
