

# GRIDALIGN

## Coordination Opportunity Report

### Georgia Power

Plant McIntosh Upgrades

**Distance between closest known points:** 12.58 km

### Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

## PROJECTS

- Plant McIntosh Upgrades: Natural gas power plant upgrade adding 268 MW of capacity in Rincon, Effingham County, Georgia, associated with Georgia Power.
- Riverport 115kV Tap: Construct Tap: Transmission tap construction spanning from Okatie to Riverport in Jasper County, South Carolina.

## WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points of these two projects are 12.58 km apart, placing them in the under 40 km geographic coordination tier.

## GEOGRAPHIC ANALYSIS

At a distance of 12.58 km across the Georgia-South Carolina border region, the projects are too far apart to share physical rights-of-way, local access roads, or adjacent laydown yards. However, being well under 40 km apart, the sites are within a reasonable proximity where utilities could potentially coordinate regional mobilization, specialized heavy equipment, and regional contractor pools.

## TIMELINE ANALYSIS

Project B is currently in progress with an estimated completion date of December 1, 2026, though its start date is not provided. Project A is approved, but its start date, completion date, and duration are not stated in the record. Because schedule information for Project A is incomplete, timeline compatibility cannot be fully confirmed.

## COORDINATION OPPORTUNITIES

If the construction schedules overlap, the two projects could potentially pursue the following coordination efforts:

- Sharing specialized equipment, such as heavy-lift cranes or heavy transport vehicles, if both projects require these resources in the Savannah and Jasper County area.
- Sharing specialized contractors or labor crews qualified in high-voltage electrical or heavy civil utility works.
- Coordinating regional equipment mobilization and demobilization to decrease duplicate transit expenses.

- Conducting regional outage timing and grid operations reviews to ensure work at both locations does not create simultaneous regional electrical transmission constraints.

## **POTENTIAL BENEFITS**

Coordinating shared mobilization could potentially reduce transport expenses for heavy machinery. In addition, joint regional planning may improve contractor availability and prevent conflicting transmission outages in the regional grid.

## **RISKS AND LIMITATIONS**

- Project A lacks start and completion dates, making it impossible to verify whether field construction will occur simultaneously.
- The projects feature different scopes of work, with one focusing on natural gas generation upgrades and the other on transmission tap construction.
- The projects are situated in different states (Georgia and South Carolina) and are managed by different entities, which may introduce administrative or jurisdictional hurdles.
- Specific equipment and contractor needs for both projects are not documented.

## **FINAL ASSESSMENT**

### **MEDIUM**

Meaningful coordination appears plausible for regional contractor sharing, heavy equipment mobilization, and transmission outage planning within 12.58 km, but important uncertainty remains regarding Project A's timeline and the differing scopes of work.

## **RECOMMENDED NEXT STEP**

Utility project managers should exchange projected construction calendars to determine whether the Plant McIntosh upgrade timeline overlaps with the active Riverport tap construction window.
