Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Upgrades

Distance between closest known points: 32.82 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Upgrades, associated with Georgia Power.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, located in South Carolina (operating utility not specified in the supplied records).

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points of the two projects are separated by 32.82 km, placing them within the under 40 km coordination threshold.

GEOGRAPHIC ANALYSIS

At a distance of 32.82 km across the Georgia and South Carolina state border, the projects are too far apart for shared rights-of-way, common access roads, or combined localized work sites. However, under the 40 km threshold, the projects are close enough that utilities may be able to coordinate regional mobilization, specialized contractor availability, or regional grid operations.

TIMELINE ANALYSIS

Project B is currently in progress with an estimated completion date of August 12, 2026. In contrast, Project A is listed as approved, but start and completion dates are not provided. Because Project A lacks published schedule data, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

Although the work scopes differ, the projects could explore several potential coordination avenues:

- Outage timing: If the Vogtle upgrade requires unit or transmission interconnection outages, grid operators could potentially coordinate transmission clearance schedules with the Urquhart - Toolebeck line rebuild to maintain regional system stability.
- Specialized contractor utilization: If specialized high-voltage testing, engineering, or electrical commissioning contractors are needed in the regional market, the utilities could potentially coordinate schedules to minimize separate mobilization efforts.

- Regional transportation: If heavy electrical components require specialized transit routing, regional delivery windows could potentially be coordinated to avoid local transport constraints.

POTENTIAL BENEFITS

- Coordinated outage scheduling may reduce the risk of regional transmission congestion or grid reliability issues.
- Information sharing on contractor mobilization could potentially yield operational efficiencies for specialized high-voltage services.

RISKS AND LIMITATIONS

- The project types are fundamentally different, consisting of an internal nuclear plant power uprate versus an overhead transmission line rebuild.
- Nuclear facilities impose strict security, badging, and quality assurance rules that generally prevent direct sharing of field crews or standard line equipment.
- Schedule overlap cannot be verified due to the missing schedule data for Project A.
- The projects reside in different states and may involve separate operating utilities, adding administrative complexity.

FINAL ASSESSMENT

LOW

Meaningful coordination is limited by the 32.82 km distance, the distinct technical disciplines (nuclear generation uprate versus overhead line construction), nuclear security restrictions, and unconfirmed schedule overlap. Useful cooperation is likely restricted to high-level regional outage timing and grid reliability planning.

RECOMMENDED NEXT STEP

Transmission and generation planning engineers should hold a regional reliability call to verify whether the Urquhart - Toolebeck rebuild outage schedule interacts with planned Vogtle uprate implementation activities.
