

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Upgrades

Distance between closest known points: 34.26 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Upgrades, Georgia Power, Burke County, Georgia.
- Project B: Atomic Road 115/12kV Sub: Construct, Aiken County, South Carolina (utility company not specified).

WHY GRIDALIGN FLAGGED THIS PAIR

The projects were flagged based on geographic proximity. The closest known points are separated by 34.26 km, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At a distance of 34.26 km, direct site sharing, common laydown yards, and shared access roads are not viable. However, under the 40 km threshold, the projects are close enough that utilities could potentially share regional contractors, heavy equipment mobilization, or coordinate regional electrical reliability planning across the Georgia-South Carolina border region.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to incomplete schedule information. Project A is approved but has no reported start or end dates. Project B is planned with an estimated completion date of December 31, 2028, but no start date is supplied. It is uncertain whether active construction periods will overlap.

COORDINATION OPPORTUNITIES

- Regional contractor sharing: The projects may be able to draw from the same regional pool of high-voltage electrical contractors or civil works providers.
- Equipment mobilization: If heavy-lift cranes or specialized heavy-haul transport vehicles are required, contractors could potentially sequence mobilization between sites to lower travel overhead.
- Regional transmission and outage planning: Regional grid operators may benefit from coordinating any necessary transmission line outages or system studies, ensuring the 115/12kV substation work does not conflict with the 54 MW upgrade integration at Plant Vogtle.

POTENTIAL BENEFITS

- Potential savings on heavy equipment mobilization expenses if specialized resources can be sequenced regionally.
- Enhanced grid reliability by preventing concurrent, conflicting transmission outages in the regional network.
- More efficient utilization of local high-voltage electrical trade labor.

RISKS AND LIMITATIONS

- Incompatible construction scopes: Project A is a specialized nuclear generation facility modification governed by rigorous nuclear security and regulatory standards, while Project B is a standard utility distribution/transmission substation.
- Data gaps: Missing schedule dates for both projects prevent verification of simultaneous work.
- Jurisdictional separation: The facilities are located in different states (Georgia and South Carolina) and appear to be managed by different entities.

FINAL ASSESSMENT

LOW

Meaningful coordination is limited because the projects involve vastly different scopes (a nuclear plant power uprate versus a standard local substation build), reside in separate states, and lack confirmed schedule overlap, despite falling within the 40 km regional window.

RECOMMENDED NEXT STEP

Utility project managers should hold a brief introductory call to share planned construction years and determine whether regional transmission outage coordination will be necessary.
