

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 20.83 km

Dominion Energy South Carolina

Jackson 115kV: Construct 115 - 12kV Distribution Substation

PROJECTS

- Plant Vogtle Units 1 & 2 Extended Power Uprates (Georgia Power / Plant Vogtle), an approved nuclear power plant upgrade in Burke County, Georgia.
- Jackson 115kV: Construct 115 - 12kV Distribution Substation, a planned substation replacement project in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

The projects were flagged due to geographic proximity. Their closest known points are 20.83 km apart, placing them within GridAlign's under 40 km coordination tier.

GEOGRAPHIC ANALYSIS

At a distance of 20.83 km across the Georgia-South Carolina border, the sites are too distant for shared local access roads, common rights-of-way, or unified laydown yards. However, being under 40 km apart, the proximity could potentially allow regional-level cooperation, such as the regional dispatch of specialized electrical contractors, heavy transport resources, or regional system operations planning.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed. Project A provides no start date or completion date. Project B has an estimated completion date of December 31, 2028, but lists no start date. Because schedule details for Project A and start details for Project B are missing, active construction overlap cannot be verified.

COORDINATION OPPORTUNITIES

- Regional electrical specialty contractors could potentially be utilized by both projects if their construction phases coincide.
- Specialized heavy-haul transport, crane services, or high-voltage testing equipment may be shared or sequenced regionally if both projects require them.
- Regional outage planning could be coordinated between system operators to ensure major generation uprate testing does not conflict with distribution substation cutovers.

- Coordinated scheduling could potentially reduce duplicate mobilization fees for regional testing and engineering consultants.

POTENTIAL BENEFITS

- Potential decrease in mobilization costs if specialized regional vendors can service both sites during the same mobilization window.
- Enhanced grid reliability by coordinating potential electrical outages across the regional transmission and distribution boundary.

RISKS AND LIMITATIONS

- Major differences in project scope: nuclear power plant uprates require specialized nuclear-grade engineering and quality assurance that rarely align with standard 115 - 12kV distribution substation work.
- Nuclear site security protocols, background checks, and stringent badging requirements could prevent standard construction crews from moving between sites.
- The two projects are in separate states and jurisdictions (Georgia versus South Carolina).
- Complete absence of Project A schedule dates limits immediate coordination planning.

FINAL ASSESSMENT

LOW

Although the projects are located 20.83 km apart, nuclear power plant uprates and distribution substation construction involve fundamentally different operational, safety, and regulatory environments. Nuclear work requires unique qualifications that prevent straightforward labor and resource sharing with standard substation projects, and missing timeline data limits practical coordination to high-level grid reliability planning.

RECOMMENDED NEXT STEP

Project planners should exchange high-level construction and testing schedules to identify whether system outage windows might conflict between now and late 2028.
