Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 3 & 4, a nuclear power plant project developed by Georgia Power in Burke County, Georgia.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, a transmission line rebuild project in Aiken County, South Carolina. The operating utility is not explicitly identified in the supplied record.

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged based on geographic proximity. The closest known points are 32.82 km apart, placing the pair in the under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 32.82 km across the Georgia-South Carolina state boundary, the projects are too far apart to share access roads, right-of-way, or physical laydown yards. However, being under 40 km apart, the sites are within a radius where utilities could potentially share regional resources, specialized contractors, or regional grid planning efforts.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed. Project B is marked as In Progress with an estimated completion date of August 12, 2026, though its start date is not provided. Project A does not contain any start date, end date, or status information in the provided record. It is therefore unknown whether active construction periods will overlap.

COORDINATION OPPORTUNITIES

- Regional contractor engagement: If specialized high-voltage electrical contractors are needed, the utilities could potentially explore shared regional procurement or sequential contracting if construction schedules overlap.
- Specialized equipment sharing: Specialized heavy transport or crane services may be able to be coordinated across the region if both sites require similar capabilities.

- Outage timing and grid planning: Regional transmission operators could potentially coordinate transmission line outages on the 115kV line with regional grid conditions surrounding the Plant Vogtle site.

POTENTIAL BENEFITS

- Possible reduction in regional mobilization costs if heavy equipment or specialized crews can be sequenced between the sites.
- Enhanced regional grid reliability through coordinated transmission outage planning.
- Qualitative communication benefits between regional electric infrastructure planners.

RISKS AND LIMITATIONS

- Distinct project scopes: A major nuclear power generation facility and an overhead 115kV transmission line rebuild have substantially different technical, safety, and security requirements.
- Missing schedule data: Complete lack of milestone dates for Project A makes any temporal alignment uncertain.
- Jurisdictional division: The projects reside in different states (Georgia and South Carolina), likely involving separate regulatory frameworks and operating entities.
- Distance prevents any shared direct site logistics.

FINAL ASSESSMENT

LOW

Meaningful coordination is limited because the projects involve vastly different scopes, sit in different states 32.82 km apart, and Project A lacks schedule data. Coordination is likely restricted to high-level regional transmission outage scheduling and potential regional contractor mobilization.

RECOMMENDED NEXT STEP

Project managers should exchange schedule milestones to clarify whether active construction windows overlap and determine if transmission line outages on the Urquhart - Toolebeck project require regional coordination with Plant Vogtle.
