Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 34.26 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

Plant Vogtle Units 3 & 4 is a nuclear power plant project developed by Georgia Power in Burke County, Georgia. Atomic Road 115/12kV Sub: Construct is a planned substation construction project in Aiken County, South Carolina, sponsored by an unspecified utility.

WHY GRIDALIGN FLAGGED THIS PAIR

These projects were flagged because their closest known coordinates are separated by 34.26 km, placing them within GridAlign's under-40-km screening threshold for regional utility coordination.

GEOGRAPHIC ANALYSIS

At a distance of 34.26 km across the Georgia-South Carolina border, the sites are too far apart for shared access roads, adjacent rights-of-way, or combined localized staging. However, this distance falls within a radius where regional construction planning, specialized equipment mobilization, or shared contractor networks could potentially be explored if logistical requirements align.

TIMELINE ANALYSIS

Project B has a planned completion date of December 31, 2028, with no start date provided. Project A contains no start date, completion date, or current status in the supplied records. Because schedule information for Project A is completely absent, timeline compatibility and potential construction overlap cannot be confirmed.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, potential areas of cooperation could include:

- Inquiring whether regional electrical or high-voltage contractors could service both project sites to coordinate mobilization.
- Exploring whether specialized heavy-haul transport or mobile crane equipment may be shared across the regional corridor if needed.

- Exchanging regional grid planning information to identify whether transmission outages or switching requirements could potentially affect local grid stability.

POTENTIAL BENEFITS

- Minor reductions in equipment or contractor mobilization expenses if regional specialty vendors can be scheduled sequentially.
- Improved cross-border utility communication and regional situational awareness between operating entities in neighboring counties.

RISKS AND LIMITATIONS

- Major disparity in project scope and type, contrasting a multi-unit nuclear power station with a single 28 MVA distribution substation.
- Geographic and jurisdictional separation across state boundaries involves different regulatory agencies, permitting processes, and utility organizations.
- The 34.26 km separation prevents sharing physical laydown yards, daily work crews, or direct site access routes.
- Incomplete schedule data prevents verifying whether any concurrent construction will occur.

FINAL ASSESSMENT

LOW

While the projects sit within 34.26 km of each other, the vast difference in construction scope, the jurisdictional separation across state lines, and unconfirmed schedule overlap suggest that only limited or indirect regional coordination could realistically occur.

RECOMMENDED NEXT STEP

Planners should contact the respective project managers to determine Project A's timeline and verify whether any regional contractor procurement or high-voltage outage planning could potentially overlap.
