Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 32.82 km

Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

PROJECTS

- Plant Vogtle Units 3 & 4: Nuclear power plant construction project developed by Georgia Power in Burke County, near Waynesboro, Georgia.
- Urquhart - Aiken PSA 46 kV: Rebuild: A 4.5-mile, 46 kV transmission line rebuild project located between Beech Island and Aiken in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this project pair because the closest known points are 32.82 km apart, placing them within the under 40 km regional coordination distance category.

GEOGRAPHIC ANALYSIS

At a distance of 32.82 km, these sites are too far apart for direct physical integration, shared right-of-way, joint access roads, or common localized staging areas. However, projects separated by under 40 km across the Georgia-South Carolina border region may still be positioned to coordinate regional logistics, contractor engagement, and mobilization of specialized equipment.

TIMELINE ANALYSIS

Timeline compatibility cannot be confirmed. Project B is planned with an end date of December 31, 2027, but provides no start date. Project A has no start date, end date, or status provided in the source records. Because Project A lacks all schedule details and Project B has only a completion deadline, it is impossible to verify whether their active build windows will coincide.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, the projects could potentially benefit from:

- Shared contractors: Regional high-voltage electrical or civil contractors could potentially be engaged across both sites.
- Equipment mobilization: Heavy specialized equipment, such as large cranes or specialized hauling units, may be coordinated sequentially to lower regional mobilization costs.

- Regional workforce planning: Specialized labor crews could potentially transition between sites if work phases align.
- Coordinated freight deliveries: Bulk material shipments could potentially coordinate routing along shared regional transport corridors.

POTENTIAL BENEFITS

- Reduced mobilization and freight expenses if regional contractors and heavy machinery can serve both projects.
- Improved workforce availability through regional labor pool planning.
- Greater regional awareness regarding transmission and generation activities across the local power grid.

RISKS AND LIMITATIONS

- Major scope disparity: A multi-unit nuclear power plant differs significantly from a 4.5-mile, \$3,000,000 transmission rebuild in technical standards, security, and supply chain needs.
- Missing schedule data: The absence of dates and operational status for Project A makes concurrent activity entirely uncertain.
- Jurisdictional division: The projects reside in different states (Georgia and South Carolina), likely involving different operating utilities and regulatory environments.
- Distance constraints: A separation of 32.82 km prevents any direct on-site cooperation.

FINAL ASSESSMENT

LOW

While the projects fall within the 32.82 km regional threshold, the vast difference in project types, the cross-state regulatory divide, and the complete lack of schedule data for Project A indicate that only limited or indirect regional coordination could be feasible.

RECOMMENDED NEXT STEP

Request current construction status and schedule milestones for Plant Vogtle Units 3 & 4 from Georgia Power to verify if active field operations will coincide with the Aiken line rebuild.
