Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, a transmission line and new substation project in Georgia. Operating utility company is not specified.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, a transmission line rebuild project in South Carolina. Operating utility company is not specified.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 35.68 km, placing them within the under 40 km regional coordination threshold.

GEOGRAPHIC ANALYSIS

At a distance of 35.68 km, the projects are too far apart to share right-of-way, access roads, or local laydown yards. However, being under 40 km, the projects are close enough that utilities could potentially coordinate regional planning, share specialized equipment, or coordinate contractor mobilization across the nearby state border.

TIMELINE ANALYSIS

The supplied schedules indicate minimal or no active overlap:

- Project B is listed as In Progress with a completion date of August 12, 2026. Its start date is not provided.
- Project A is in Planning with an estimated start date of Spring 2027. Its completion date is not provided.

Because Project B concludes several months before Project A begins, active construction overlap cannot be confirmed from the supplied data. Furthermore, timeline compatibility cannot be fully confirmed due to missing start and end dates.

COORDINATION OPPORTUNITIES

- Sequential contractor utilization: Qualified contractors completing Project B in late 2026 could potentially mobilize directly to Project A in Spring 2027.

- Specialized equipment transitions: Heavy transmission equipment or wire-pulling machinery used on Project B may be transferable to Project A if work requirements align.
- Regional construction scheduling: Planners could coordinate regional outage planning and high-voltage workforce availability across the border region.

POTENTIAL BENEFITS

- Potential reduction in mobilization and demobilization expenses if regional transmission line contractors or specialized machinery can transition sequentially between the projects.
- Improved regional contractor availability and utility planning visibility across neighboring service areas.

RISKS AND LIMITATIONS

- Timing gap: Current data indicates Project B finishes approximately six to nine months before Project A begins, limiting opportunities for simultaneous shared resources.
- Technical differences: Project A involves 500 kV infrastructure and a new 500/230 kV substation, while Project B involves a 115 kV line rebuild; different crew specializations, materials, and equipment may be required.
- Cross-state jurisdiction: The projects are situated in different states (Georgia and South Carolina), which may involve separate regulatory bodies and permitting constraints.
- Incomplete information: Project A lacks cost and completion data; Project B lacks start date data; neither record identifies the operating utility.

FINAL ASSESSMENT

LOW

The projects are separated by 35.68 km, state lines, differing voltage classes, and an apparent scheduling gap of several months. Practical coordination is primarily limited to sequential contractor or equipment transitions if schedules align.

RECOMMENDED NEXT STEP

Facilitate an exploratory discussion between project managers to determine whether transmission contractors concluding work on the Urquhart - Toolebeck rebuild could be considered for upcoming procurement on the Callaway Road - Thomson project.
