

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 37.50 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV (Transmission Line). Utility company is not specified in the supplied data.
- Project B: Atomic Road 115/12kV Sub: Construct (Substation Construction). Utility company is not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 37.5 km, placing them in the under-40-km regional coordination tier.

GEOGRAPHIC ANALYSIS

At 37.5 km apart across the Georgia and South Carolina state boundary, the projects are too distant for shared rights-of-way, access roads, or common laydown yards. However, this distance is within a range that may allow regional construction planning, shared mobilization, and regional sharing of specialized contractors or equipment.

TIMELINE ANALYSIS

Project A has a planned start date of Spring 2027, with no completion date specified. Project B has a target completion date of December 31, 2028, with no start date provided. If Project B conducts construction during 2027 or 2028, the build windows could potentially overlap. Because schedule data is incomplete for both projects, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Shared specialized contractors: Project A includes the construction of the new Callaway Road Substation, while Project B involves a new distribution substation. The utilities could potentially use the same regional electrical contractors.
- Equipment mobilization: Heavy rigging, cranes, or specialized substation testing apparatus could potentially be shared or sequenced between sites to reduce duplicate transport efforts.

- Regional logistics planning: If construction schedules overlap, teams may be able to coordinate equipment delivery timelines to optimize regional supplier resources.

POTENTIAL BENEFITS

- Potential reduction in mobilization and demobilization expenses for specialized heavy equipment and crews.
- Potential administrative and pricing efficiencies if regional contractors can be engaged for both substation scopes.
- Improved regional visibility to avoid simultaneous demands on regional electrical utility labor pools.

RISKS AND LIMITATIONS

- Operating utility names are absent from the provided records, making organizational compatibility unknown.
- Missing start and completion dates prevent verification of a concurrent working window.
- The projects feature significant differences in scope and voltage class, contrasting a major 500 kV transmission and substation build with a \$3.65 million 115/12 kV distribution substation.
- Physical distance of 37.5 km prevents any immediate day-to-day site or laydown sharing.

FINAL ASSESSMENT

LOW

While both projects involve substation work within the same regional market around 2027 to 2028, the 37.5 km distance, incomplete schedule information, and differing project scales mean that any potential cooperation is limited to high-level contractor procurement or specialized equipment mobilization.

RECOMMENDED NEXT STEP

The utilities should exchange firm construction schedules to determine whether a shared mobilization window exists for substation installation and testing contractors between 2027 and 2028.
