

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 39.56 km

Dominion Energy South Carolina

Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in

PROJECTS

- Project A: Effingham County 500 kV, located in Effingham County, Georgia. The utility company is not specified in the provided data.
- Project B: Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in, located in Beaufort County, South Carolina. The utility company is not specified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points of these two projects are 39.56 km apart. This places them in GridAlign's under-40-km screening category, which flags broader regional coordination opportunities.

GEOGRAPHIC ANALYSIS

At 39.56 km apart across the Georgia and South Carolina state boundary, the projects are too far apart to share access roads, right-of-way, or physical laydown yards. However, this distance is within a range that could potentially allow utilities to coordinate regional workforce availability, specialized high-voltage contractors, or regional transmission planning.

TIMELINE ANALYSIS

- Project A lists a start date of Fall 2027 and is in the planning stage, with an unlisted completion date.
- Project B is in progress with an estimated completion date of 12/31/2026, with an unlisted start date.

Based on the supplied dates, the build windows do not overlap. Project B is scheduled to finish at least several months before Project A begins. Because schedule data is incomplete for both projects, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Contractor sequencing: If high-voltage transmission or substation contractors conclude work on Project B in late 2026, regional planners could potentially evaluate those contractors for mobilization to Project A in late 2027.

- Specialized equipment availability: If heavy equipment or testing gear is demobilized from Project B, regional managers may be able to anticipate regional equipment availability for Project A.
- Regional transmission and outage planning: Both projects involve 230 kV elements in neighboring utility areas, which could potentially allow engineering teams to coordinate transmission studies or regional system planning.

POTENTIAL BENEFITS

- Potential qualitative reduction in remobilization expenses if qualified contractors or specialized resources can transition within the broader region.
- Enhanced regional grid awareness and planning between neighboring high-voltage systems.

RISKS AND LIMITATIONS

- Active construction schedules do not overlap based on current data.
- The 39.56 km distance and state boundary prevent direct on-site logistical or laydown sharing.
- Crucial project details, including operating companies and complete milestone dates, are missing.

FINAL ASSESSMENT

LOW

The projects lie near the maximum threshold of the geographic screening zone (39.56 km) and have non-overlapping schedules based on available dates. Coordination is limited to indirect benefits such as regional contractor sequencing or planning awareness if schedules shift.

RECOMMENDED NEXT STEP

Project managers should share milestone schedule updates to determine whether Project B's completion or Project A's start shifts toward an overlapping window.
