Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 26.34 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

Project A: Effingham County 500 kV, located in Effingham County, Georgia. The operating utility is not identified in the provided data.

Project B: Jasper - Okatie 230 kV #2: Construct, located in Jasper County, South Carolina. The operating utility is not identified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because the closest known points are 26.34 km apart, placing them within the under 40 km geographic screening threshold.

GEOGRAPHIC ANALYSIS

At a distance of 26.34 km across the Georgia and South Carolina border area, the projects are too far apart for physical site-level integration, such as shared laydown yards, joint access roads, or direct right-of-way sharing. However, this distance is close enough to potentially permit regional coordination, such as utilizing shared regional contractors, specialized transmission line equipment, or sequential workforce mobilization.

TIMELINE ANALYSIS

- Project B is currently listed as in progress, with an end date of December 1, 2026, though its start date is not provided.
- Project A is in the planning stage, with an estimated start date of Fall 2027 and an unspecified completion date.
- Based on the supplied dates, active construction windows do not appear to overlap, showing a gap of approximately nine to twelve months between Project B finish and Project A start.
- Because Project B lacks a start date and Project A lacks an end date, full timeline compatibility cannot be confirmed.

COORDINATION OPPORTUNITIES

If future schedule adjustments bring the active periods closer together, the projects could potentially consider:

- Sequential contractor transitions, where specialized transmission crews concluding work on Project B could potentially mobilize to Project A.
- Coordinated transfer or retention of specialized transmission and substation equipment within the regional area.
- Regional transmission and outage planning coordination, if the projects affect interconnected grid pathways across the state line.

POTENTIAL BENEFITS

- Reduced remobilization costs if regional contractors and equipment can remain in the area rather than demobilizing fully.
- Retaining experienced high-voltage construction labor familiar with local regional terrain and supply logistics.

RISKS AND LIMITATIONS

- A notable schedule separation exists, as Project B is scheduled to finish before Project A is scheduled to begin.
- The projects reside in different states (Georgia and South Carolina), likely involving separate utility operators, jurisdictions, and permitting agencies.
- Incomplete schedule data limits the ability to evaluate real-time overlap.

FINAL ASSESSMENT

LOW

Although the projects are 26.34 km apart and both involve high-voltage transmission infrastructure, the supplied dates show a distinct scheduling gap between the completion of Project B and the start of Project A, leaving only limited opportunities for sequential resource coordination.

RECOMMENDED NEXT STEP

Utility project managers should exchange updated schedule milestones as Project A finishes planning to evaluate whether sequential contractor or equipment transitions could be feasible.
