

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 26.34 km

Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

PROJECTS

- Effingham County 500 kV: Located in Effingham County, Georgia. Operating company is not specified in the supplied data.
- Riverport 115kV Tap: Construct Tap: Located in Jasper County, South Carolina. Operating company is not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged these projects because the distance between their closest known points is 26.34 km. This places them in the under 40 km distance category.

GEOGRAPHIC ANALYSIS

At 26.34 km apart across the Georgia and South Carolina state line, the projects are too distant to share access roads, laydown yards, or right-of-way. However, being within 40 km, the projects may still be close enough to allow regional construction planning, shared specialized equipment, or coordinated contractor mobilization across the broader regional area.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to incomplete schedule data and non-overlapping milestones:

- Project A is listed in planning with an estimated start date of Fall 2027 and an unspecified completion date.
- Project B is listed as in progress with an estimated completion date of December 1, 2026, and an unspecified start date.

Based on the supplied dates, active construction does not appear to overlap. There is an approximate gap of nine to ten months between the completion of Project B and the start of Project A.

COORDINATION OPPORTUNITIES

If Project B extends or if Project A begins early, the utilities could potentially explore:

- Sequential contractor engagement, allowing specialized transmission line contractors to transition from Jasper County to Effingham County.
- Shared specialized equipment, such as heavy cranes or line tensioning equipment, if regional contractors remain deployed in the area.
- Regional transmission outage coordination, if transmission grid operators determine that concurrent or sequential work impacts regional power transfers.

POTENTIAL BENEFITS

- Potential reduction in mobilization costs if specialized transmission contractors can be retained regionally rather than demobilizing fully.
- Improved regional awareness of heavy utility equipment availability and contractor capacity across the regional market.

RISKS AND LIMITATIONS

- Schedule gap: The current dates indicate Project B concludes in late 2026, while Project A starts in late 2027.
- Missing data: Both utility owners, complete construction duration dates, and detailed routing coordinates are not provided.
- Cross-border jurisdiction: The projects are situated in different states, which may involve distinct operating companies, regulatory filings, and permitting processes.

FINAL ASSESSMENT

LOW

The projects are within 26.34 km of each other and involve transmission construction, but known schedules show a gap of roughly nine months between Project B finish and Project A start. As a result, only limited or indirect coordination, such as sequential contractor transition, appears plausible.

RECOMMENDED NEXT STEP

Utility planners should exchange updated schedule milestones to verify whether schedule adjustments create an active overlap or a direct contractor handover window.
