Coordination Opportunity Report

Georgia Power

Plant McIntosh Upgrades

Distance between closest known points: 24.74 km

Dominion Energy South Carolina

Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in

PROJECTS

Project A: Plant McIntosh Upgrades, Georgia Power (referenced in filing source).

Project B: Okatie 230-115kV Substation, Jasper - Yemassee 230kV #1 Fold-in, utility sponsor in South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are 24.74 km apart, placing them in the under 40 km regional coordination category.

GEOGRAPHIC ANALYSIS

At 24.74 km apart, the sites are too distant to share daily work sites, access roads, or common laydown yards. However, this distance is within a range where utilities could potentially coordinate regional contractor mobilization, heavy transport logistics, and specialized equipment deployment across the Georgia-South Carolina border region.

TIMELINE ANALYSIS

Project B is classified as in progress with an estimated completion date of December 31, 2026, though its start date is not provided. Project A is approved, but both its start date and completion date are missing from the record. Because schedule information for Project A is incomplete, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

Although Project A is a natural gas plant expansion and Project B is a transmission substation expansion and line fold-in, the projects could explore:

- Shared regional contractors or specialized high-voltage electrical crews, if construction timing coincides.
- Coordinated mobilization of specialized heavy-lift cranes or heavy-haul transport equipment traveling through the regional corridor.

- Regional transmission outage coordination, if connecting the 268 MW generator upgrade and folding in the 230 kV line affect adjacent power flows.
- Joint planning for regional construction support services or testing resources.

POTENTIAL BENEFITS

Effective coordination could potentially reduce duplicate mobilization charges for specialized high-voltage contractors and heavy equipment. It may also enhance regional grid reliability by preventing simultaneous, conflicting transmission outages during cut-over and testing phases.

RISKS AND LIMITATIONS

- Major schedule uncertainty exists because Project A has no recorded construction start or completion dates.
- The projects cross state lines (Georgia and South Carolina), likely involving different operating utilities, regulatory frameworks, and permitting authorities.
- The scopes of work are substantially different (natural gas thermal generation additions versus high-voltage substation line fold-in work), which limits overlap among primary labor crafts.
- The 24.74 km distance precludes shared site-level logistics or physical staging areas.

FINAL ASSESSMENT

LOW

While both projects represent major regional energy infrastructure within 25 km of each other, the differing construction types, interstate regulatory separation, and lack of timeline data for Project A limit coordination primarily to indirect regional scheduling, mobilization, or outage planning.

RECOMMENDED NEXT STEP

Project managers should initiate an informal planning inquiry to determine the construction build window for Plant McIntosh and identify whether electrical interconnection outages could overlap with the Okatie substation cut-over before late 2026.
