Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 34.26 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Plant Vogtle Units 3 & 4, Georgia Power. Nuclear power plant construction in Burke County, Georgia.
- Project B: Atomic Road 115/12kV Sub: Construct, operating utility not specified. Substation construction in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The projects are separated by 34.26 km, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At a distance of 34.26 km across the Georgia-South Carolina state line, the projects are too far apart to share access roads, right-of-way, or physical work zones. However, this distance is within standard regional mobilization boundaries. The proximity could potentially allow the utilities to coordinate regional support services, specialized contractors, or shared equipment vendors operating in the greater Augusta area.

TIMELINE ANALYSIS

- Project A provides no start date or end date in the supplied data.
- Project B lists a planned end date of 12/31/2028, with no start date specified.

Because schedule information is incomplete for both projects, timeline compatibility cannot be fully confirmed. A shared construction window remains possible if Project A activities extend toward late 2028.

COORDINATION OPPORTUNITIES

- Shared specialized contractors: Both sites involve high-voltage electrical installations and could potentially utilize the same regional electrical contractors if work occurs concurrently.
- Heavy equipment mobilization: Heavy-lift cranes or specialized electrical testing rigs mobilized to the region may be able to serve both sites, reducing standalone transit costs.

- Coordinated deliveries: If heavy equipment or electrical components share regional transportation corridors, freight logistics could potentially be coordinated.

POTENTIAL BENEFITS

- Reduced mobilization expenses if specialized contractors or heavy equipment providers can be scheduled consecutively or concurrently.
- Improved resource availability by coordinating regional demand for qualified high-voltage labor.

RISKS AND LIMITATIONS

- Scope disparity: Project A is a major nuclear power facility with stringent nuclear-grade quality, security, and safety standards, whereas Project B is a smaller \$3.6M distribution-level substation.
- Data gaps: Project A lacks schedule, status, and cost data. Project B does not identify an owning utility or start date.
- Distance constraints: At 34.26 km, direct daily logistical sharing or combined laydown yards are not viable.
- Multi-state jurisdiction: Projects are in different states (Georgia and South Carolina), which may involve different regulatory bodies and independent operating utilities.

FINAL ASSESSMENT

LOW

Meaningful coordination is limited. While the projects are 34.26 km apart, the significant difference between nuclear construction and standard substation work, combined with missing schedule information and cross-border jurisdictions, restricts potential cooperation to high-level regional vendor or equipment sharing.

RECOMMENDED NEXT STEP

Project planners should confirm whether their active construction windows overlap to determine if shared regional heavy-haul or crane vendors are feasible.
