Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 32.82 km

Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 3 & 4, a nuclear power plant facility developed by Georgia Power in Waynesboro, Burke County, Georgia.
- Project B: Urquhart - Aiken PSA 46 kV: Rebuild, a 4.5-mile transmission line rebuild project located from Beech Island to Aiken in Aiken County, South Carolina, with an unspecified utility company.

WHY GRIDALIGN FLAGGED THIS PAIR

This project pair was flagged based on geographic proximity. The closest known points between the two project locations are 32.82 km apart, which places them within GridAlign's under 40 km evaluation category.

GEOGRAPHIC ANALYSIS

A separation distance of 32.82 km across the Georgia-South Carolina state line indicates the projects are located within the same broader regional market, but not in immediate vicinity. Under GridAlign distance criteria, projects under 40 km may still be close enough to support regional construction planning, shared mobilization, or coordination of specialized equipment and contractors. However, this distance is too great to realistically allow shared laydown yards, joint right-of-way management, common access roads, or daily on-site logistics.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to missing data. Project B is in planned status with a stated completion date of December 31, 2027, but lacks an identified start date. Project A does not provide start or end dates in the supplied data, and its current construction status is not recorded. Without definitive construction schedules for both facilities, it is not possible to confirm whether active construction activities will coincide.

COORDINATION OPPORTUNITIES

If the construction schedules overlap and compatible needs arise, the utilities could potentially pursue:

- Regional contractor sharing, if the transmission rebuild and power plant support services require similar regional trade contractors.

- Shared mobilization or coordination of specialized heavy transport equipment if heavy hauling resources are needed in the Augusta-Aiken regional corridor.
- High-level regional utility scheduling and communication to ensure major work does not create conflicting logistical demands.

POTENTIAL BENEFITS

- Potential reduction in equipment transport and mobilization expenses if specialized regional contractors or machinery can be shared or sequenced.
- Enhanced regional coordination of utility activities across state boundaries.

RISKS AND LIMITATIONS

- Substantial technical divergence: a major nuclear power plant has drastically different engineering, security, and quality standards compared to a 4.5-mile, 46 kV transmission rebuild.
- Schedule uncertainty remains high because Project A lacks all milestone dates and Project B lacks a start date.
- Cross-border execution across Georgia and South Carolina involves differing state jurisdictions and regulatory frameworks.
- The owning utility for Project B is not documented in the provided record.

FINAL ASSESSMENT

LOW

Although the projects are separated by 32.82 km, the coordination potential is low due to fundamental differences in construction scope, distinct state regulatory environments, and unverified schedule overlap. Feasible cooperation would likely be limited to indirect regional contractor mobilization or general corridor awareness.

RECOMMENDED NEXT STEP

The utilities should contact each other to confirm project schedules and determine if any shared regional contracting or heavy equipment mobilization needs align before 2027.
