

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 20.83 km

Dominion Energy South Carolina

Jackson 115kV: Construct 115 - 12kV Distribution Substation

PROJECTS

- Project A: Plant Vogtle Units 3 & 4, developed by Georgia Power in Burke County, Georgia.
- Project B: Jackson 115kV: Construct 115 - 12kV Distribution Substation, located in Aiken County, South Carolina (utility owner not specified in provided data).

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points are 20.83 km apart, placing the projects within GridAlign's under 40 km distance category.

GEOGRAPHIC ANALYSIS

A separation distance of 20.83 km places these projects within the under 40 km tier. At this distance, direct physical site coordination, such as shared access roads, laydown yards, or right-of-way sharing, is not viable. However, this proximity could potentially permit broader regional coordination, including shared mobilization of specialized resources, contractors, or heavy equipment traveling within the Georgia-South Carolina border region.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed based on the supplied data. Project A provides no start date, end date, or status information. Project B lists a planned status with an end date of 12/31/2028, but provides no start date. Without schedule details for Project A, it cannot be determined whether active construction windows will coincide.

COORDINATION OPPORTUNITIES

- Shared contractors: The projects may be able to utilize common electrical, civil, or high-voltage subcontractors operating in the regional market if construction schedules overlap.
- Equipment mobilization: If heavy-lift cranes or specialized electrical testing gear are required by both projects, contractors could potentially coordinate transport to reduce mobilization costs.

- Regional delivery planning: If major electrical components or bulk materials require regional transport, suppliers could potentially coordinate logistics across shared regional freight routes.

POTENTIAL BENEFITS

- Potential reduction in duplicate mobilization and demobilization expenses for regional contractors.
- Opportunities to leverage existing regional supply networks and specialized labor pools.
- Enhanced regional scheduling awareness that could potentially minimize competition for local resources.

RISKS AND LIMITATIONS

- Substantial schedule uncertainty exists because Project A has no reported start or completion dates.
- Fundamental project type and scale mismatch: Plant Vogtle is a major nuclear power plant with rigorous regulatory and quality control standards, whereas Project B is a localized \$3,003,760 distribution substation replacement. Nuclear-grade qualifications may not transfer to standard distribution work.
- The projects are located in different states (Georgia and South Carolina), which involves separate regulatory frameworks and limits permitting coordination.

FINAL ASSESSMENT

LOW

Although the distance of 20.83 km falls within the regional threshold, coordination potential is limited. The vast disparity in project scale, differing nuclear versus distribution regulatory standards, and complete absence of timeline data for Project A restrict potential cooperation to minor, indirect regional contractor or mobilization synergies.

RECOMMENDED NEXT STEP

Project planners should confirm the active construction schedule for Plant Vogtle Units 3 & 4 to establish whether any future site activities overlap with Project B's planned work leading up to 12/31/2028.
