

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 35.68 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, located in Georgia (Columbia and McDuffie counties). Operating utility is not stated in the source data.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, located in Aiken County, South Carolina. Operating utility is not stated in the source data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 35.68 km, placing them within the under 40 km screening category.

GEOGRAPHIC ANALYSIS

At a distance of 35.68 km across the Georgia and South Carolina state line, the projects are too far apart to share access roads, rights-of-way, or localized staging yards. However, this separation falls within the distance category where utilities may potentially coordinate regional contractor mobilization, regional transmission planning, or the transfer of specialized heavy transmission equipment.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to incomplete schedule information. Project B is in progress and scheduled to finish on August 12, 2026, but has no recorded start date. Project A is in planning with an expected start in Spring 2027 and no recorded completion date. Based on the provided dates, the active construction windows do not directly overlap, leaving a gap of roughly six to eight months. Overlap would occur only if Project B encounters schedule extensions or if Project A commences preliminary field activities ahead of schedule.

COORDINATION OPPORTUNITIES

- Sequential contractor mobilization: Regional transmission contractors completing work on Project B in late 2026 could potentially transition crews to Project A for its Spring 2027 start.

- Specialized equipment transitions: If specialized wire-pulling, tensioning, or heavy transport equipment is required, contractors may be able to stage or relocate machinery between these nearby regional projects instead of demobilizing out of the region.
- Regional outage coordination: Regional grid operators could potentially review outage timing across the broader area to ensure system stability during work near the state border.

POTENTIAL BENEFITS

- Potential reduction in equipment mobilization costs if heavy machinery can remain in the regional area between late 2026 and early 2027.
- Improved workforce continuity for specialized regional high-voltage transmission personnel.

RISKS AND LIMITATIONS

- Incompatible construction windows: Available schedules indicate Project B concludes before Project A begins.
- Jurisdictional and voltage differences: The projects involve different operating states (Georgia versus South Carolina) and different voltage classes (500 kV new build versus 115 kV rebuild), which may require different engineering specifications, contractor qualifications, and permitting bodies.
- Data gaps: Neither project profile includes complete start and end dates, and project operators are not identified.

FINAL ASSESSMENT

LOW

While both projects involve high-voltage transmission lines within 36 km of each other, their schedules are consecutive rather than concurrent. Meaningful synergy is limited primarily to sequential contractor or equipment transitions across the region.

RECOMMENDED NEXT STEP

Utility planners should exchange schedule updates to confirm whether Project B completion aligns closely enough with Project A mobilization to justify regional contractor or equipment coordination.
