

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 20.05 km

Dominion Energy South Carolina

Hooks - Modoc 115/46 kV Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV (Georgia; operating utility not stated)
- Project B: Hooks - Modoc 115/46 kV Rebuild (South Carolina; operating utility not stated)

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this project pair based on geographic proximity. The closest known points are approximately 20.05 km apart, placing them in the under 40 km coordination tier.

GEOGRAPHIC ANALYSIS

At a distance of 20.05 km, the projects are too far apart to share rights-of-way, local access roads, or immediate construction staging areas. However, under the 40 km threshold, the projects are close enough that utilities could potentially share regional resources, specialized high-voltage line equipment, contractor pools, and regional mobilization planning across the Georgia and South Carolina border area.

TIMELINE ANALYSIS

- Project A lists a planned start date of Spring 2027, with no end date provided.
- Project B lists a completion date of December 31, 2027, with no start date provided.

Because both projects have confirmed activity scheduled during calendar year 2027, there is plausible timeline overlap. However, because Project A lacks a completion date and Project B lacks an initiation date, full timeline compatibility cannot be confirmed.

COORDINATION OPPORTUNITIES

- Contractor sharing: If both projects require high-voltage transmission construction contractors in 2027, the utilities could potentially engage common contracting firms.
- Mobilization alignment: Regional mobilization and demobilization of equipment or personnel may be coordinated to avoid redundant transport.

- Specialized equipment: Heavy wire-pulling, stringing, or SPDC rebuild equipment could potentially be shared or sequenced between sites if schedules permit.
- Regional transmission scheduling: Transmission operators could coordinate planned outage sequencing to minimize local grid stability impacts.

POTENTIAL BENEFITS

- Potential cost efficiencies if duplicate equipment mobilization across the region is reduced.
- Improved workforce availability if specialized transmission crews can be sequenced between the two regional sites.
- Minimized grid operational stress through coordinated line outage timing during 2027.

RISKS AND LIMITATIONS

- Incomplete timeline data: Neither project provides both start and completion dates, making schedule alignment uncertain.
- Cross-state jurisdiction: The projects are located in different states (Georgia and South Carolina) and likely involve distinct utility organizations and regulatory processes.
- Differing work scopes: Project A involves new 500 kV transmission lines and a new 500/230 kV substation, while Project B is a 6.5-mile 115/46 kV rebuild; voltage classes and technical requirements differ significantly.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination is plausible because both projects involve overhead transmission work within 20.05 km and have active build schedules in 2027. However, the rating remains medium due to missing schedule bounds, differing project scopes, and cross-state administrative boundaries.

RECOMMENDED NEXT STEP

Utility project managers should hold a joint coordination meeting to exchange detailed 2027 construction schedules and evaluate joint contracting opportunities.
