

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 37.50 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV (company not specified in provided data)
- Project B: Atomic Road 115/12kV Sub: Construct (company not specified in provided data)

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between the projects are 37.5 km apart. This places the pair in GridAlign's under 40 km distance tier, indicating potential opportunities for regional-level coordination.

GEOGRAPHIC ANALYSIS

At 37.5 km apart across the Georgia-South Carolina state line, the sites are too distant for shared right-of-way, access roads, or a common laydown yard. However, being under 40 km may allow regional construction planning, coordinated transit of heavy machinery, or shared regional contractor resources across the Thomson, Georgia and North Augusta, South Carolina areas.

TIMELINE ANALYSIS

Project A lists a start date of Spring 2027 with no end date provided. Project B lists an end date of 12/31/2028 with no start date provided. If the construction schedules overlap during the 2027 to 2028 window, field work could occur concurrently. However, timeline compatibility cannot be fully confirmed because schedule information is incomplete for both projects.

COORDINATION OPPORTUNITIES

Although Project A is a 500 kV transmission line and substation build and Project B is a 115/12 kV distribution substation construction, the utilities could potentially explore:

- Shared regional contractors or civil crews, if compatible scopes of work are identified.
- Coordinated deployment of specialized equipment, such as heavy cranes or oil-handling rigs, if this equipment is required at both sites.
- Sequenced regional scheduling to avoid competing for specialized utility craft labor.

- Coordinated mobilization of specialized electrical testing or commissioning personnel.

POTENTIAL BENEFITS

- Reduced duplicate mobilization expenses if heavy equipment or specialized service providers can be shared across the region.
- Lower risk of regional labor bottlenecks through cooperative scheduling.
- Improved regional logistical efficiency if deliveries of heavy apparatus can be planned cooperatively.

RISKS AND LIMITATIONS

- The projects are located in different states (Georgia and South Carolina), which may involve different regulatory, environmental, and permitting frameworks.
- The project types and scopes differ significantly in scale, ranging from a major 500 kV bulk transmission build to a single \$3.6M 115/12 kV substation.
- Missing start and completion dates prevent verification of actual schedule overlap.
- Utility operating companies are not specified in the supplied records, so existing operational relationships are unknown.

FINAL ASSESSMENT

LOW

While geographic proximity is within 40 km and schedules may overlap between 2027 and 2028, differing project scales, cross-state boundaries, and incomplete schedule data limit realistic coordination to indirect regional resource or mobilization sharing.

RECOMMENDED NEXT STEP

Utility planners should exchange preliminary construction schedules and contractor requirements to identify whether joint mobilization of specialized equipment or electrical crews could be feasible during 2027 and 2028.
