

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 35.68 km

Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

PROJECTS

Project A: Callaway Road - Thomson Primary 500 kV, planned in Georgia (operating utility not specified in provided data).

Project B: Urquhart - Aiken PSA 46 kV: Rebuild, planned in South Carolina (operating utility not specified in provided data).

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged based on geographic proximity. The closest known points between the two projects are 35.68 km apart, placing them in the under 40 km coordination tier.

GEOGRAPHIC ANALYSIS

At a separation distance of 35.68 km across the Georgia-South Carolina state line, direct site sharing, shared access roads, and joint right-of-way management are not viable. However, being within 40 km means the projects could potentially coordinate at a regional level. This distance may allow regional project teams to share contractors, coordinate specialized equipment mobilization, or synchronize regional construction schedules.

TIMELINE ANALYSIS

Project A has an identified start date of Spring 2027, with no completion date specified. Project B lists a scheduled completion date of December 31, 2027, but does not provide a start date. Because both projects encompass construction activity during 2027, their schedules could potentially overlap during that year. However, because neither project includes a complete schedule showing both start and finish dates, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

If the construction timelines coincide in 2027, the following coordination opportunities could be considered:

- Coordinated contractor procurement or regional labor sharing, if qualified regional contractors can serve both scopes.

- Shared mobilization and demobilization of specialized heavy equipment or line construction machinery operating within the wider Augusta-Aiken regional market.
- Information exchange regarding regional material deliveries and vendor availability.
- Regional transmission outage sequencing, if work on either system influences bulk power flows across the regional grid.

POTENTIAL BENEFITS

- Potential reduction in contractor mobilization expenses if common regional resources can be scheduled sequentially or concurrently.
- Improved regional workforce and equipment availability by avoiding simultaneous uncoordinated demand for line construction resources.
- Enhanced regional grid reliability through proactive communication regarding planned transmission line outages.

RISKS AND LIMITATIONS

- Distinct project scopes: Project A involves high-voltage 500 kV lines and a new 500/230 kV substation, whereas Project B is a 46 kV sub-transmission rebuild; specialized equipment and crew certifications may not align.
- Jurisdictional separation: The projects reside in different states (Georgia and South Carolina), which involves distinct permitting authorities, regulatory bodies, and potentially separate utility operators.
- Distance: At 35.68 km apart, immediate site-level synergies like shared laydown yards or shared daily work crews are impractical.
- Incomplete schedule data limits the ability to confirm concurrent field work.

FINAL ASSESSMENT

LOW

While the projects are within the 40 km regional radius and both indicate planned activity in 2027, coordination potential is limited. The substantial disparity in operating voltages (500 kV versus 46 kV), separate state jurisdictions, and 35.68 km separation mean that only limited or indirect regional coordination appears useful.

RECOMMENDED NEXT STEP

Utility project managers should hold an initial briefing to compare detailed 2027 construction milestones and determine whether regional contractor mobilization or outage scheduling overlaps warrant joint coordination.
