

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 20.05 km

Dominion Energy South Carolina

Modoc - McCormick 115/46 kV Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, located in Georgia. The operating utility company is not specified in the supplied data.
- Project B: Modoc - McCormick 115/46 kV Rebuild, located in McCormick County, South Carolina. The operating utility company is not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between the projects are 20.05 km apart. This places the pair in GridAlign's under 40 km distance category, signaling possible opportunities for regional construction coordination.

GEOGRAPHIC ANALYSIS

A distance of 20.05 km across the Georgia-South Carolina border region is too far to allow direct sharing of localized rights-of-way, access roads, or common site-level laydown yards. However, being under 40 km apart, the locations are close enough that utilities could potentially coordinate regional contractor mobilization, specialized equipment movement, and high-level area resource dispatch.

TIMELINE ANALYSIS

Project A has a planned start date of Spring 2027 with no specified completion date. Project B has a targeted end date of December 31, 2029, with no specified start date. Because schedule records are incomplete for both projects, timeline compatibility cannot be fully confirmed. However, both initiatives indicate planned work taking place in the late 2020s, indicating that active construction windows could potentially overlap between 2027 and 2029.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, the two projects could explore the following coordination activities:

- Shared regional contractors, if qualified transmission contractors can be procured to execute work on both project corridors.

- Shared specialized heavy equipment or cranes, if equipment mobilization can be sequenced between the sites.
- Joint mobilization and demobilization planning to reduce regional transport costs.
- Coordinated outage timing, if transmission line clearances affect shared regional power flow across the area.

POTENTIAL BENEFITS

Coordination may enable the utilities to reduce duplicate equipment mobilization and transport expenditures. Shared planning could also help avoid local contractor resource bottlenecks and reduce regional grid vulnerability during necessary line outages.

RISKS AND LIMITATIONS

- Incomplete timeline data leaves actual concurrent field construction unconfirmed.
- The technical requirements differ significantly, as Project A involves 500 kV transmission line and substation construction, whereas Project B involves a 115/46 kV line rebuild.
- The projects cross state lines between Georgia and South Carolina, which could involve different utility owners, separate regional operating boundaries, and distinct state regulatory environments.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible based on the 20.05 km distance and overlapping late-2020s time horizons, but important uncertainty remains regarding incomplete schedules, cross-state boundaries, and distinct voltage class requirements.

RECOMMENDED NEXT STEP

Project planners should initiate an inter-utility coordination discussion to share preliminary construction schedules and identify whether common transmission contractors or equipment can be jointly mobilized.
