

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 20.29 km

Dominion Energy South Carolina

Stevens Creek - Graniteville 115 kV: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV (Operating in Georgia; utility company not specified in provided data)
- Project B: Stevens Creek - Graniteville 115 kV: Rebuild (Operating in South Carolina; utility company not specified in provided data)

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because the closest known points between the projects are 20.29 km apart. This falls into the under 40 km category, which represents regional proximity.

GEOGRAPHIC ANALYSIS

At 20.29 km apart, the projects are located in neighboring states (Georgia and South Carolina) across the regional Savannah River corridor. At this distance, the projects are too far apart to share right-of-way or access roads. However, an under 40 km separation may allow regional project planners to coordinate contractor procurement, heavy construction equipment transport, and workforce deployment across the region.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to incomplete scheduling data:

- Project A reports a start date of Spring 2027 with no end date specified.
- Project B reports an end date of 12/31/29 with no start date specified.

Both projects appear to be active in the late 2020s. If construction on Project B occurs between 2027 and 2029, their active construction windows could potentially overlap.

COORDINATION OPPORTUNITIES

If timelines align, the project teams could potentially pursue several coordination opportunities:

- Shared contractors: The utilities could potentially engage the same regional transmission line contractors or environmental specialists.

- Equipment mobilization: The projects may be able to share specialized transmission construction equipment or cranes, reducing overall transport trips across the region.
- Crew sharing: Specialized line construction or rebuild crews could potentially be sequenced between the two jobs.
- Outage and regional grid planning: Planners could potentially coordinate high-voltage transmission outages to avoid concurrent stability constraints across the Georgia-South Carolina border.

POTENTIAL BENEFITS

- Reduced mobilization expenses if specialized machinery or contractor crews can be shared or sequentially scheduled.
- Improved transmission system reliability if regional outage schedules are coordinated in advance.
- Better regional contractor availability and material delivery planning.

RISKS AND LIMITATIONS

- Cross-border jurisdiction: The projects sit in different states (Georgia and South Carolina), likely involving different utilities, regional transmission entities, and state regulatory permitting bodies.
- Voltage and scope differences: Project A involves new 500 kV infrastructure and a new 500/230 kV substation, whereas Project B is a 115 kV line rebuild; required equipment, structure types, and crew qualifications may differ substantially.
- Schedule uncertainty: Missing end dates for Project A and missing start dates for Project B create significant timing uncertainty.
- Missing company ownership details prevent confirming whether these utilities already possess joint operating agreements.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible at a regional contractor, equipment, and transmission outage planning level. However, important uncertainty remains due to missing timeline boundaries and cross-state administrative differences.

RECOMMENDED NEXT STEP

The project managers should hold an initial joint coordination call to compare detailed construction schedules and evaluate whether shared contractor mobilization or coordinated outage scheduling is feasible.
