Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 26.34 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

Project A is the Effingham County 500 kV project, located in Effingham County, Georgia. Its utility sponsor is not specified in the supplied data.

Project B is the Jasper - Okatie 230 kV #2: Construct project, located in Jasper County, South Carolina. Its utility sponsor is also not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 26.34 km, placing them within the under-40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 26.34 km across the Georgia-South Carolina border, these projects are too far apart to share right-of-way, local access roads, or common laydown yards. However, this separation is within regional range. It may allow the utilities to coordinate regional mobilization, specialized contractors, or heavy equipment movements if operational timing aligns.

TIMELINE ANALYSIS

Project B is currently in progress with an estimated completion date of December 1, 2026, though its start date is not provided. Project A is in the planning phase with an estimated start date of Fall 2027 and an unstated completion date. Based on the provided dates, active construction windows do not appear to overlap, showing a gap of approximately nine months between the completion of Project B and the start of Project A. Because schedule details are incomplete, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

If schedules shift or planning overlaps occur, potential areas of cooperation could include:

- Contractor transition: Specialized transmission line contractors completing Project B could potentially transition crews to Project A.

- Regional mobilization: Heavy installation equipment or specialized transport resources could potentially be retained in the region to avoid duplicate mobilization.
- Regional transmission planning: System operators may be able to coordinate transmission outage schedules and regional reliability assessments across the adjacent service areas.

POTENTIAL BENEFITS

Coordination could potentially lower overall mobilization and demobilization expenses by keeping qualified high-voltage transmission crews in the local area. It may also provide regional planners with clearer visibility into transmission system changes across neighboring jurisdictions.

RISKS AND LIMITATIONS

- Current schedules indicate sequential rather than concurrent work, creating a multi-month gap that limits immediate resource sharing.
- The projects reside in different states (Georgia and South Carolina), which may involve differing regulatory processes, utilities, and permitting standards.
- Differences in voltage class (500 kV versus 230 kV) mean specialized material requirements and construction practices may not be directly interchangeable.
- Incomplete schedule data limits the ability to confirm potential timeline overlap.

FINAL ASSESSMENT

LOW

While the projects are within regional proximity (26.34 km), available data indicates sequential construction schedules separated by several months. This gap, combined with cross-state jurisdictional boundaries and incomplete project information, limits immediate coordination value.

RECOMMENDED NEXT STEP

Project managers from both initiatives should conduct a regional planning check-in to exchange schedule updates and determine whether contractors completing Project B could potentially support upcoming work on Project A.
