Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 26.34 km

Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

PROJECTS

Project A: Effingham County 500 kV, a transmission line and substation project in Effingham County, Georgia. The operating company is not identified in the provided data.

Project B: Riverport 115kV Tap: Construct Tap, a transmission tap construction project in Jasper County, South Carolina. The operating company is not identified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points between the projects are 26.34 km apart, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At a separation of 26.34 km across the Georgia-South Carolina state line, the projects are too far apart to share daily access roads, rights-of-way, or physical construction sites. However, projects under 40 km apart may still be close enough to coordinate regional construction logistics, specialized transmission equipment, contractor resources, and regional mobilization efforts.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to incomplete schedule information. Project B is listed as in progress with a scheduled completion date of December 1, 2026, but lacks a listed start date. Project A is in the planning stage with an estimated start date of Fall 2027 and no stated completion date. Based on the supplied dates, active construction schedules do not appear to overlap, leaving a gap of approximately nine to twelve months between Project B ending and Project A beginning.

COORDINATION OPPORTUNITIES

- Sequential contractor utilization: If specialized high-voltage transmission contractors conclude work on Project B, they could potentially be retained or re-engaged regionally for Project A.
- Equipment availability: Heavy transmission or substation construction equipment demobilized from Project B might be staged regionally if the schedule gap narrows.

- Regional vendor and supplier communication: Project teams could potentially share market intelligence regarding local supplier lead times and regional material availability.

POTENTIAL BENEFITS

- Reduced regional contractor remobilization costs if crews can be retained within the local area.
- Improved workforce availability through sequenced regional scheduling.
- Increased awareness of regional utility construction activity and supply chain conditions.

RISKS AND LIMITATIONS

- Based on available dates, there is no direct timeline overlap to support simultaneous resource sharing.
- The projects are situated in different states (Georgia and South Carolina), which may involve different operating utilities, regional entities, and permitting authorities.
- The 26.34 km distance prevents shared laydown yards, common access routes, or unified work sites.
- Missing data includes Project A's completion date, Project B's start date, and the specific utility companies responsible for each asset.

FINAL ASSESSMENT

LOW

While the projects are within 26.34 km of each other, available data indicates no concurrent construction overlap, with Project B finishing roughly nine months before Project A begins. Coordination is therefore limited to potential sequential contractor or equipment transitions across the regional market.

RECOMMENDED NEXT STEP

Utility project planners should make contact to compare upcoming schedule updates and evaluate whether schedule adjustments might allow sequential contracting or equipment transfers.
