Coordination Opportunity Report

Georgia Power

Plant McIntosh Upgrades

Distance between closest known points: 12.58 km

Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

PROJECTS

- Project A: Plant McIntosh Upgrades, associated with Georgia Power filings, located in Rincon, Effingham County, Georgia.
- Project B: Riverport 115kV Tap: Construct Tap (alias 6367 D), located in Hardeeville, Jasper County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points between the projects are 12.58 km apart, placing them within the under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 12.58 km, the projects are not close enough to share access roads, laydown yards, or rights-of-way. However, falling within the under 40 km category means the projects are located within the same regional corridor across the Georgia-South Carolina border. This distance may allow project teams to coordinate regional construction planning, specialized equipment mobilization, and regional contractor pools.

TIMELINE ANALYSIS

- Plant McIntosh Upgrades: Status is Approved, but start and completion dates are not supplied.
- Riverport 115kV Tap: Status is In Progress, with an end date of December 1, 2026, though a start date is not supplied.

Because schedule data for Project A is incomplete, timeline compatibility cannot be fully confirmed. Potential overlap depends on whether construction on Plant McIntosh begins before late 2026.

COORDINATION OPPORTUNITIES

- Shared contractors: If specialized regional civil or electrical contractors are needed, the utilities could potentially engage the same contracting firms.

- Shared specialized equipment: If heavy-lift cranes or heavy-haul transport vehicles are required, the projects may be able to share regional equipment to prevent separate mobilization runs.
- Regional delivery scheduling: If construction schedules overlap, project managers could potentially align freight deliveries through regional transportation corridors around Savannah.

POTENTIAL BENEFITS

- Reduced mobilization and demobilization costs if heavy equipment can be shared between the sites.
- Potential efficiency gains from leveraging common regional specialized labor forces.
- Minimized regional logistical conflicts by coordinating large equipment transport.

RISKS AND LIMITATIONS

- Incomplete schedule information for Plant McIntosh prevents verification of timing alignment.
- Scopes of work differ significantly: Project A is a natural gas plant capacity expansion, whereas Project B is a transmission tap construction project.
- Cross-state regulatory and operating division: Project A is located in Georgia and Project B is located in South Carolina, likely involving different operating entities.
- Distance prevents any shared on-site logistics, laydown areas, or physical work zones.

FINAL ASSESSMENT

LOW

While the projects are 12.58 km apart, they represent distinct utility asset types located across state borders. Because schedule alignment cannot be confirmed from the supplied data and physical interaction is minimal, only limited or indirect regional coordination appears useful.

RECOMMENDED NEXT STEP

Utility planners should communicate to share estimated construction schedules and identify whether any regional heavy-equipment mobilization needs overlap before December 2026.
