Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 32.82 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, a nuclear power plant upgrade in Burke County, Georgia, associated with Georgia Power.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, a 12.5-mile transmission line rebuild in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are 32.82 km apart, placing them within the under 40 km geographic filter category.

GEOGRAPHIC ANALYSIS

At a distance of 32.82 km across the Georgia-South Carolina state line, the projects are too far apart to share right-of-way, local access roads, or common laydown yards. However, being under 40 km apart, the sites may still be close enough to permit high-level regional construction planning, coordinated transmission outage scheduling, or shared regional mobilization of specialized electrical equipment and contractor resources.

TIMELINE ANALYSIS

- Project A is listed as Approved, but start and completion dates are not provided.
- Project B is listed as In Progress, with a scheduled completion date of August 12, 2026, though its start date is not specified.

Because Project A lacks schedule details, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Outage timing coordination: Grid operators could potentially coordinate construction outages to avoid simultaneous regional transmission and generation disruptions.
- Regional contractor mobilization: If both projects require specialized high-voltage electrical contractors or testing crews, sequencing work could potentially reduce travel and mobilization costs.

- Specialized equipment sharing: Heavy-lift cranes or specialized electrical testing gear could potentially be shared or sequenced across sites if operational windows align.
- Regional grid integration: Utility engineers may be able to align regional transmission capacity planning with the delivery of the 54 MW uprate.

POTENTIAL BENEFITS

- Reduced risk of regional grid congestion or uncoordinated system outages during construction.
- Potential efficiency gains from shared regional mobilization of qualified electrical contractors and specialized tooling.
- Improved regional grid reliability across neighboring service territories.

RISKS AND LIMITATIONS

- Scope incompatibility: Project A involves nuclear plant internal uprates, whereas Project B involves external overhead line rebuilds and structure replacements.
- Missing schedule data: Without timeline information for Project A, actual construction overlap cannot be validated.
- Jurisdictional separation: The projects operate in different states (Georgia and South Carolina) with potentially different operating utilities and regulatory frameworks.
- Physical distance limits any shared daily site logistics or access routes.

FINAL ASSESSMENT

LOW

Meaningful direct coordination is limited. Although the projects are 32.82 km apart, they involve substantially different work types across separate jurisdictions, and missing schedule information for Project A makes joint execution uncertain. Cooperation is primarily restricted to regional outage scheduling and broad grid planning.

RECOMMENDED NEXT STEP

Regional grid planners should share target construction windows and required line outage schedules to confirm whether the transmission rebuild and nuclear uprate activities present any overlapping operational impacts.
