

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 34.26 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, associated with Georgia Power.
- Project B: Atomic Road 115/12kV Sub: Construct, an electric utility project in South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because the closest known points are 34.26 km apart. This falls into the under 40 km category, where projects may be close enough to evaluate regional coordination, shared contractors, or shared equipment mobilization.

GEOGRAPHIC ANALYSIS

At a distance of 34.26 km across the Georgia-South Carolina state line, the projects are too far apart for direct site sharing, common access roads, or shared laydown yards. However, the proximity may allow regional planning teams to evaluate shared contractor pools or coordinated mobilization of heavy construction equipment if similar specialized resources are needed in the Augusta-Aiken regional market.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed because schedule data is incomplete.

- Plant Vogtle Units 1 & 2 Extended Power Uprates is approved, but both start and end dates are null.
- Atomic Road 115/12kV Substation has an end date of 12/31/2028, but its start date is null.

Without confirmed construction schedules, it is unknown whether active field work will overlap.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, potential coordination could include:

- Shared regional contractors or electrical trade crews working across regional substations and facilities.
- Coordinated mobilization of heavy rigging or high-capacity cranes, if such equipment is required by both sites during the same regional window.

- Shared vendor deliveries or bulk freight routing for specialized electrical components.
- Regional transmission and grid outage timing coordination, if the nuclear power uprate electrical interconnections and the new 115 kV substation tie-ins affect the same regional bulk power flows.

POTENTIAL BENEFITS

- Potential reduction in mobilization charges if specialized heavy-haul transport or crane vendors can serve both projects sequentially.
- Improved regional grid reliability by coordinating potential electrical clearance windows or transmission outages in advance.
- Increased regional contractor availability through aligned labor demand planning.

RISKS AND LIMITATIONS

- Major differences in project scale and type: Project A is a major nuclear power plant power uprate, whereas Project B is a localized 115/12kV distribution substation valued at \$3,646,027.
- Nuclear plant construction requires highly specialized nuclear-grade safety, security, and quality certifications that standard distribution substation contractors typically do not possess.
- Missing start dates for both projects and a missing completion date for Project A make schedule alignment completely speculative.
- The projects are situated in different states (Georgia and South Carolina) and are managed by different operating entities.

FINAL ASSESSMENT

LOW

While the projects are within the 40 km screening threshold, the specialized nuclear requirements of Plant Vogtle, the modest scale of the Atomic Road substation, the lack of schedule dates, and the jurisdictional separation make meaningful direct coordination unlikely. Any shared benefits are limited to indirect regional vendor mobilization or broad transmission outage planning.

RECOMMENDED NEXT STEP

Utility project managers should establish an initial communication to exchange projected construction schedules and confirm whether transmission outage planning overlaps between the two sites.
