

# GRIDALIGN

## Coordination Opportunity Report

### Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

**Distance between closest known points:** 32.82 km

### Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

## PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, associated with Georgia Power filings, located in Burke County, Georgia.
- Project B: Urquhart - Aiken PSA 46 kV: Rebuild, located between Beech Island and Aiken in Aiken County, South Carolina.

## WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 32.82 km, placing them in the under 40 km distance threshold.

## GEOGRAPHIC ANALYSIS

At 32.82 km apart, the projects are separated by a state border and are too distant to share rights-of-way, access roads, or local laydown yards. However, being within the 40 km threshold means the projects are located within the same broader regional market, which may allow the utilities to coordinate regional mobilization, specialized contractor resources, or broad area transmission reliability.

## TIMELINE ANALYSIS

Schedule compatibility cannot be fully confirmed. Project A provides no start date or end date in the supplied records. Project B has a targeted completion date of 12/31/2027, but its start date is missing. Without published construction windows for Project A, it is impossible to determine whether physical work will coincide.

## COORDINATION OPPORTUNITIES

- Shared regional contractors: If both projects require high-voltage electrical contractors or testing specialists, the utilities could potentially explore shared contracting resources.
- Equipment mobilization: Specialized electrical testing gear or heavy transport equipment could potentially be coordinated across projects to reduce regional transfer fees.
- Outage timing and grid reliability: Transmission planners could coordinate outage scheduling between the nuclear facility and the 46 kV subtransmission rebuild to ensure local network security.

## **POTENTIAL BENEFITS**

- Possible reduction in duplicate equipment transportation and contractor mobilization costs if regional activities can be sequenced efficiently.
- Enhanced regional transmission reliability by avoiding concurrent or conflicting electrical outages during testing and construction.

## **RISKS AND LIMITATIONS**

- Highly divergent scopes: Nuclear uprate engineering requires specialized, security-controlled plant modifications, whereas transmission line rebuilds require line crews and standard right-of-way machinery.
- Multi-jurisdictional division: The projects are located in different states (Georgia and South Carolina) with different operating environments.
- Data gaps: Incomplete scheduling data and scope details prevent confirming any operational overlap.

## **FINAL ASSESSMENT**

### **LOW**

Meaningful synergy is limited. Although the projects are 32.82 km apart, their scopes differ significantly, cross-state boundaries apply, and schedule compatibility is uncertain. Only indirect coordination around regional contractor presence or outage scheduling appears plausible.

## **RECOMMENDED NEXT STEP**

The respective project managers should exchange projected construction timelines to determine if work windows overlap and verify that outage plans do not conflict.
