

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 20.83 km

Dominion Energy South Carolina

Jackson 115kV: Construct 115 - 12kV Distribution Substation

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, located at Plant Vogtle in Burke County, Georgia (affiliated with Georgia Power).
- Project B: Jackson 115kV: Construct 115 - 12kV Distribution Substation, located in Jackson, Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points of the two projects are separated by 20.83 km, placing them in the under 40 km coordination tier.

GEOGRAPHIC ANALYSIS

At 20.83 km apart, the sites are too distant to share access roads or rights-of-way. However, this distance falls within a regional footprint where utilities may be able to coordinate mobilization. If local routing across the state boundary allows, resources such as heavy transport, specialized testing units, or regional construction oversight could potentially serve both locations.

TIMELINE ANALYSIS

- Project A: Start date and end date are not provided.
- Project B: Start date is not provided; target completion date is December 31, 2028.

Because schedule information for Project A is completely missing and Project B lacks a start date, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, the projects could explore:

- Shared regional contractors: Both projects may be able to contract with the same regional electrical or civil engineering firms.

- Coordinated equipment mobilization: Specialized high-voltage apparatus, testing equipment, or heavy cranes could potentially be staged or transported sequentially between sites.
- Regional transmission outage coordination: Grid operators may need to coordinate transmission switching if power uprate cutovers and substation integration affect the local regional grid.

POTENTIAL BENEFITS

- Reduced duplicate freight and mobilization charges for heavy electrical equipment and specialized contractors.
- Minimized grid stability risks through coordinated outage planning across the local regional network.
- Streamlined regional supply logistics if both jobs can utilize similar electrical materials or local distribution hubs.

RISKS AND LIMITATIONS

- Missing schedule data prevents determining whether active construction windows will coincide.
- Project scopes are highly disparate; a nuclear power plant uprate requires strict nuclear quality assurance, badging, and regulatory protocols that standard distribution substation crews cannot fulfill.
- The projects reside in different states (Georgia and South Carolina), likely involving different operating utilities and separate regulatory authorities.

FINAL ASSESSMENT

LOW

Meaningful coordination is limited by the major differences between nuclear plant modifications and standard distribution substation construction, separate state jurisdictions, and unconfirmed schedule alignment.

RECOMMENDED NEXT STEP

Project planners should confirm the expected construction schedule for the Plant Vogtle uprates to evaluate whether any high-voltage electrical testing or outage requirements overlap with the Jackson substation build.
