Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 3 & 4

Distance between closest known points: 32.82 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 3 & 4, Georgia Power (Nuclear Power Plant)
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, company not specified (Transmission Line Rebuild)

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points of these two projects are 32.82 km apart. This places the pair in GridAlign's under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 32.82 km across the Georgia and South Carolina state border, the projects are not adjacent. However, being under 40 km apart, they may be close enough to support regional construction coordination, shared mobilization, or shared specialized resources across the regional market.

TIMELINE ANALYSIS

- Project A has no provided start date, end date, or status.
- Project B is listed as In Progress with an end date of 8/12/2026, but has no listed start date.

Because schedule details for Project A are completely missing, timeline compatibility cannot be fully confirmed. It is unknown whether active construction phases will overlap before August 2026.

COORDINATION OPPORTUNITIES

If construction schedules overlap, potential coordination could include:

- Sharing specialized high-voltage electrical contractors or civil contractors operating in the Augusta regional area.
- Sharing heavy-duty transport, crane services, or specialized tensioning equipment if such equipment is required by both sites.
- Coordinated regional material deliveries to optimize freight and logistics routing.

- Joint regional transmission outage planning to maintain grid stability during construction activities.

POTENTIAL BENEFITS

- Potential reduction in contractor mobilization costs by coordinating regional dispatch.
- Opportunities to secure competitive pricing for shared materials or heavy machinery rentals.
- Improved regional grid reliability by coordinating potential electrical outages across neighboring utility systems.

RISKS AND LIMITATIONS

- Major differences in project types: a massive nuclear power generation facility versus a 12.5-mile 115 kV transmission line rebuild.
- Nuclear construction involves rigorous, specialized regulatory and security requirements that may prevent sharing personnel, staging areas, or equipment.
- The projects reside in different states (Georgia and South Carolina) and potentially involve different operating utilities.
- Lack of schedule, status, and budget information for Project A prevents confirming whether active work coincides.

FINAL ASSESSMENT

LOW

Meaningful coordination appears limited. While the projects are within 32.82 km, the vast difference in scope between nuclear plant construction and a 115 kV line rebuild, combined with strict nuclear site constraints and unconfirmed timeline overlap, leaves only minimal potential for shared regional resources.

RECOMMENDED NEXT STEP

Utility planners should contact the Project A management team to clarify the current construction status and schedule before exploring any regional contractor sharing.
