Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 37.37 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, nuclear generation upgrade located in Burke County, Georgia. Associated with Georgia Power regulatory filings.
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, transmission line rebuild located in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points between the two projects are separated by 37.37 km, placing them in the under 40 km distance tier.

GEOGRAPHIC ANALYSIS

At a distance of 37.37 km across the Georgia-South Carolina border, the sites are too distant for shared right-of-way, common access roads, or joint laydown yards. However, this separation falls within the distance category where utilities may be able to coordinate regional mobilization, contractor availability, or specialized heavy equipment across the regional area.

TIMELINE ANALYSIS

- Project A has an approved status, but its start date and end date are not provided.
- Project B is listed as in progress, with a scheduled completion date of August 12, 2026.

Because Project A lacks schedule details, timeline compatibility cannot be fully confirmed. It is currently uncertain whether the active construction periods will overlap before Project B concludes in mid-2026.

COORDINATION OPPORTUNITIES

Even though these projects involve different scopes of work, realistic cooperation could potentially include:

- Regional contractor utilization, if common regional contractors or specialized trade labor are available in the local market.

- Specialized heavy equipment sharing, if major heavy-haul transport or crane equipment could potentially be coordinated sequentially between the regional sites.
- Regional transmission outage coordination, if transmission line clearances for Project B need to be coordinated with grid injection planning for Plant Vogtle.

POTENTIAL BENEFITS

- Reduced duplicate mobilization costs, if specialized regional equipment or transport providers can be utilized across both sites.
- Minimized grid disruption, if outage schedules for transmission rebuild activities are sequenced in harmony with regional generation modifications.
- Improved resource availability, if utilities coordinate their regional contracting demands to prevent competing for local specialty labor.

RISKS AND LIMITATIONS

- Incompatible construction activities: Project A is an internal nuclear plant power uprate subject to strict site security and nuclear regulations, while Project B is a standard 12.5-mile overhead transmission line rebuild.
- Cross-state boundary: The projects are in different states and jurisdictions (Georgia and South Carolina).
- Schedule uncertainty: The complete absence of dates for Project A prevents confirmation of any active timeline alignment.
- Distance constraints: At 37.37 km, direct daily physical site integration is not feasible.

FINAL ASSESSMENT

LOW

While both projects are located within 37.37 km, the work types are substantially different, and no schedule data is available for Project A to verify timeline overlap. Any potential coordination would be limited to high-level regional contractor awareness or indirect grid outage planning.

RECOMMENDED NEXT STEP

Utility project managers should share high-level timeline milestones once Project A schedules are published to evaluate whether regional transmission outages or contractor mobilizations overlap.
