

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 20.18 km

Dominion Energy South Carolina

Hooks - Modoc 115/46 kV Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, located in Columbia and McDuffie counties, Georgia (utility company is not specified in the supplied data).
- Project B: Hooks - Modoc 115/46 kV Rebuild, located in McCormick County, South Carolina (utility company is not specified in the supplied data).

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points of these two projects are 20.18 km apart. This places them in GridAlign's under 40 km category, which highlights projects that may be close enough to share crews, specialized equipment, contractors, mobilization efforts, or regional construction planning.

GEOGRAPHIC ANALYSIS

A distance of 20.18 km is too far for direct site-level coordination such as shared access roads, combined rights-of-way, or common laydown yards. However, the proximity across the Georgia-South Carolina border region may allow the project teams to coordinate at a regional level. Equipment and crews could potentially travel between Thomson, Georgia, and Modoc, South Carolina, if shared contractor services are utilized.

TIMELINE ANALYSIS

- Project A has a planned start date of Summer 2027, but its end date is not provided.
- Project B has an end date of December 31, 2027, but its start date is not provided.

Both projects have scheduled activity occurring in 2027. If Project B's active construction window extends into late 2027, their build periods could potentially overlap. However, because both schedules are incomplete, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Shared contractors: The project teams could potentially contract with the same regional transmission line construction vendors.

- Specialized equipment sharing: Equipment such as conductor tensioners, pullers, or heavy transport units could potentially be coordinated or sequenced between the two sites if schedules align.
- Coordinated mobilization: Joint or sequenced mobilization may be able to reduce duplicate transport of heavy equipment into the two-county border area.
- Outage timing coordination: Regional grid planners could potentially share planned outage schedules to prevent overlapping regional transmission constraints.

POTENTIAL BENEFITS

- Possible reduction in duplicate equipment mobilization and transportation efforts.
- Improved resource availability by coordinating contractor demand in the regional market.
- Reduced potential for conflicting grid outages or localized transmission bottlenecks.

RISKS AND LIMITATIONS

- Incomplete schedule data makes it impossible to guarantee that physical construction will occur simultaneously.
- The projects are in different states (Georgia and South Carolina), which may involve different utilities, labor jurisdictions, and permitting frameworks.
- The scopes of work differ significantly: Project A involves high-voltage 500 kV line construction and a new substation, whereas Project B is a 115/46 kV line rebuild.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible through shared regional contractor mobilization, equipment utilization, and regional outage planning during 2027, but important uncertainty remains regarding incomplete schedules and cross-state utility coordination.

RECOMMENDED NEXT STEP

Project managers from both projects should exchange detailed construction schedules for the second half of 2027 to verify if active build windows overlap.
