

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 37.88 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, a transmission line and substation project in Georgia.
- Project B: Atomic Road 115/12kV Sub: Construct, a substation construction project in South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between these two projects are 37.88 km apart, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At a distance of 37.88 km across the Georgia-South Carolina state line, direct physical site sharing or shared access routes is unlikely. However, this separation falls within a regional commuting distance. This proximity could potentially allow utilities to coordinate regional mobilization, specialized contractors, or regional equipment sourcing across the greater Augusta area.

TIMELINE ANALYSIS

Project A has a planned start date of Summer 2027, with no specified completion date. Project B has a target completion date of December 31, 2028, but lacks a listed start date. Because both projects indicate active planning around the 2027 to 2028 window, construction schedules may overlap. However, because neither project provides a complete schedule, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

- Regional contractor sharing: Utilities could potentially utilize common regional civil, electrical, or substation contractors serving the Central Savannah River Area.
- Specialized equipment mobilization: If heavy equipment such as cranes or specialized transformer transport vehicles are required around the same period, coordinating mobilization may reduce regional transport expenses.
- Substation labor pooling: Because Project A includes the Callaway Road Substation and Project B is a new substation, specialized electrical testing or commissioning crews could potentially be scheduled sequentially.

- Material and equipment staging: If regional logistics hubs are established, shared regional laydown space might be considered.

POTENTIAL BENEFITS

- Reduced mobilization expenses if specialized contractor crews or heavy rigging equipment can be sequenced between sites.
- Potential efficiency gains through coordinated regional procurement of compatible substation materials or aggregate.
- Improved regional workforce availability by avoiding competing labor demands for specialized high-voltage electricians.

RISKS AND LIMITATIONS

- Incomplete timeline data prevents verification of true construction overlap.
- Projects are located in different states (Georgia and South Carolina), which may involve different regulatory frameworks, permitting authorities, and utility operating companies.
- Differing voltage classes (500 kV bulk transmission versus 115/12 kV distribution substation) may require different construction standards, contractors, and specialized equipment.
- A distance of nearly 38 km rules out direct site sharing, shared access roads, or joint laydown areas.

FINAL ASSESSMENT

LOW

The projects fall within regional proximity (37.88 km) and have possible timeline overlap in the 2027 to 2028 timeframe. However, the cross-state separation, different voltage levels, separate scopes, and missing schedule details limit realistic coordination to indirect opportunities, such as sequential mobilization of regional specialty contractors.

RECOMMENDED NEXT STEP

Utility project managers should establish an initial information exchange to compare confirmed construction schedules and identify any overlapping contract solicitations in the regional market.
