

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 34.16 km

Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, located in Columbia and McDuffie counties, Georgia. The utility company is not specified in the supplied data.
- Project B: Urquhart - Aiken PSA 46 kV: Rebuild, located in Aiken County, South Carolina. The utility company is not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points of these two projects are 34.16 km apart, placing them within GridAlign's under 40 km regional coordination tier.

GEOGRAPHIC ANALYSIS

At a separation of 34.16 km across the Georgia-South Carolina state line, the projects are too far apart to share physical work areas, access roads, or local laydown yards. However, this distance is close enough that regional construction planning, shared mobilization of contractors, or regional equipment sourcing may be feasible if the utilities coordinate.

TIMELINE ANALYSIS

Project A is scheduled to start in Summer 2027, but its completion date is not specified. Project B lists an end date of December 31, 2027, with no start date provided. An overlap in late 2027 is plausible, but timeline compatibility cannot be fully confirmed due to missing schedule milestones on both sides.

COORDINATION OPPORTUNITIES

- Regional contractor sharing: The utilities could potentially use the same regional civil, clearing, or access contractors if work periods coincide.
- Shared mobilization: Specialized heavy-haul or foundation equipment could potentially be scheduled sequentially across both jobs to reduce duplicate transport expenses.
- Regional planning: Project managers may be able to coordinate regional supply deliveries and avoid competing for regional trade labor during late 2027.

POTENTIAL BENEFITS

- Potential reduction in equipment mobilization and demobilization costs if regional assets can be shared.
- Improved regional resource visibility, which may help mitigate labor or contractor shortages during active construction periods.

RISKS AND LIMITATIONS

- Incompatible construction scope: Project A involves high-voltage 500 kV transmission lines and a new 500/230 kV substation, while Project B is a 46 kV line rebuild. These distinct voltage classes often require different technical specifications, crew qualifications, and construction apparatus.
- Interstate separation: The projects operate in different states (Georgia and South Carolina) and likely under different jurisdictional rules.
- Incomplete data: Missing start and end dates prevent verification of an actual construction overlap.

FINAL ASSESSMENT

LOW

Coordination potential is low due to the 34.16 km separation, interstate jurisdiction, and distinct project scopes (500 kV greenfield infrastructure versus a 46 kV rebuild). Meaningful coordination appears limited primarily to indirect benefits such as regional contractor utilization or shared mobilization if the schedules align.

RECOMMENDED NEXT STEP

Utility planners should make contact to confirm their 2027 construction schedules and explore whether common regional contractors could be engaged for civil or site preparation tasks.
