

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 20.18 km

Dominion Energy South Carolina

Modoc - McCormick 115/46 kV Rebuild

PROJECTS

Project A: Callaway Road - Thomson Primary 500 kV, located in Columbia and McDuffie counties, Georgia. The utility sponsor is not specified in the provided data.

Project B: Modoc - McCormick 115/46 kV Rebuild, located in McCormick County, South Carolina. The utility sponsor is not specified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged these projects based on geographic proximity. The closest known points between the two projects are separated by 20.18 km, placing them in the under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 20.18 km, the projects are not adjacent, and they are located in different states (Georgia and South Carolina). However, being within 40 km means the utilities could potentially coordinate regional construction planning, share regional contractors, or coordinate the mobilization of crews and specialized heavy transmission equipment across the area.

TIMELINE ANALYSIS

Schedule compatibility cannot be fully confirmed due to missing dates in the records. Project A has a planned start date of Summer 2027 with no specified completion date. Project B has a planned completion date of December 31, 2029, with no specified start date. If the construction schedules overlap between Summer 2027 and late 2029, active coordination could occur during that shared multi-year window.

COORDINATION OPPORTUNITIES

- Shared contractors: The projects could potentially utilize the same regional transmission line contractors or engineering firms.
- Shared specialized equipment: Heavy transmission construction machinery, wire-pulling equipment, or cranes may be able to move between sites if mobilization schedules are aligned.

- Regional crew sharing: Specialized transmission line workers could potentially be shared or sequenced between the Georgia and South Carolina sites.
- Mobilization efficiency: Coordinated scheduling may allow reduced duplicate transport and mobilization expenses for regional support services.

POTENTIAL BENEFITS

- Potential cost efficiencies through coordinated contractor procurement and shared mobilization.
- Reduced competition for regional specialty utility labor during overlapping construction intervals.
- Improved regional planning visibility for supply chains and transmission hardware delivery.

RISKS AND LIMITATIONS

- Incomplete schedule data creates uncertainty regarding whether on-site activities will occur simultaneously.
- The projects cross state lines (Georgia and South Carolina), which involves different state regulatory jurisdictions and permitting processes.
- The project scopes differ in technical scale: Project A involves new 500 kV line construction and a new 500/230 kV substation, whereas Project B is a 115/46 kV rebuild and hardening effort. Some equipment and crew qualifications may not be interchangeable.
- The utility operators are not identified in the data, leaving ownership and institutional relationships uncertain.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible due to the 20.18 km distance and a potentially overlapping 2027 to 2029 construction timeframe. However, important uncertainty remains regarding exact project schedules, operating entities, and cross-state technical compatibility.

RECOMMENDED NEXT STEP

Utility planners should convene an introductory coordination meeting to share detailed construction schedules and evaluate whether shared contractor mobilization across the Georgia-South Carolina border is feasible.
