

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 24.09 km

Dominion Energy South Carolina

Stevens Creek - Graniteville 115 kV: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, operating utility not specified in the supplied data.
- Project B: Stevens Creek - Graniteville 115 kV: Rebuild, operating utility not specified in the supplied data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are separated by 24.09 km, placing them within the under-40 km coordination threshold.

GEOGRAPHIC ANALYSIS

A distance of 24.09 km separates the project areas across the Georgia and South Carolina state border. While this separation precludes direct physical overlap or shared access roads, projects under 40 km apart may still be close enough to share regional contractors, specialized equipment, mobilization efforts, and regional construction planning.

TIMELINE ANALYSIS

- Project A lists a planned start date of Summer 2027, with no completion date specified.
- Project B lists a planned end date of December 31, 2029, with no start date specified.

If Project B is under construction between Summer 2027 and late 2029, the active build windows could potentially overlap. However, because both schedules lack complete start and completion dates, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

If construction schedules overlap, the following coordination options could be considered:

- Shared contractors: The utilities could potentially contract with the same regional high-voltage transmission contractors.
- Coordinated mobilization: Staging equipment mobilization sequentially or collaboratively may reduce regional transport costs.

- Specialized equipment: If specialized heavy equipment or conductor stringing tools are required by both efforts, contractors may be able to share or re-deploy resources between sites.
- Regional transmission outage coordination: Engineering teams could potentially coordinate transmission outage schedules to minimize local grid stress across the regional border.

POTENTIAL BENEFITS

- Reduced mobilization expenses for heavy transmission construction equipment.
- Potential efficiency gains through coordinated contractor engagement in the same geographic region.
- Enhanced grid reliability by coordinating planned line outages.

RISKS AND LIMITATIONS

- Incomplete schedule details prevent confirming whether field construction will take place simultaneously.
- The projects are situated in different states (Georgia and South Carolina), which may involve differing utility entities, regulatory requirements, and permitting processes.
- Technical differences between a new 500 kV line and substation project and a 115 kV line rebuild may limit the interchangeability of certain crews and hardware.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible because both projects involve transmission line construction within 24.09 km and have potentially overlapping execution windows between 2027 and 2029. However, important uncertainty remains due to missing milestone dates, differing voltage classes, and separate state jurisdictions.

RECOMMENDED NEXT STEP

Project managers from both initiatives should initiate contact to share detailed construction schedules and evaluate whether mobilization or contractor procurement can be aligned for the 2027 to 2029 window.
