

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 26.33 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

- Effingham County 500 kV: A planned transmission infrastructure project in Effingham County, Georgia, including a new 500/230 kV substation and 500 kV transmission facilities. Operating utility company is not specified in the provided data.
- Jasper - Okatie 230 kV #2: Construct: An active transmission project in Jasper County, South Carolina, consisting of building 6.5 miles of 230 kV transmission line and a CIP hut at the Jasper substation. Operating utility company is not specified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between the projects are 26.33 km apart. This places them in GridAlign's under 40 km category, which indicates potential for regional mobilization, shared contractor capacity, and coordinated infrastructure planning.

GEOGRAPHIC ANALYSIS

At 26.33 km across the Georgia-South Carolina state border, the sites are too far apart to share physical work zones, access roads, or local rights-of-way. However, this distance is within a practical radius where utilities could potentially share specialized heavy equipment, coordinate high-voltage line crews, or align regional logistics.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed from the supplied data.

- Effingham County 500 kV is in the planning phase, with no start or end dates reported.
- Jasper - Okatie 230 kV #2 is listed as in progress, with a scheduled completion date of December 1, 2026.

If Project A advances to construction before late 2026, a window of schedule overlap could allow simultaneous or phased coordination.

COORDINATION OPPORTUNITIES

- Shared specialized contractors: The utilities could potentially engage the same regional transmission line and substation contractors to work across both locations.
- Equipment sequencing: High-capacity cranes and conductor tensioning rigs could potentially be shared or sequenced between sites to minimize transport expenses.
- Outage timing coordination: Regional grid coordinators may be able to align transmission outages to prevent concurrent line de-energizations and preserve local reliability.
- Regional delivery logistics: Material shipments and specialized component deliveries could potentially be combined across the regional transportation corridor.

POTENTIAL BENEFITS

- Reduced mobilization and demobilization costs by sequencing heavy equipment between nearby projects.
- Better regional contractor availability by coordinating procurement needs.
- Enhanced grid security through deliberate, synchronized outage scheduling.

RISKS AND LIMITATIONS

- Missing schedule dates for the Effingham County project make timeline alignment speculative.
- Cross-state location across Georgia and South Carolina may involve different balancing authorities, state regulators, and environmental permitting frameworks.
- Differences in voltage class (500 kV versus 230 kV) may require different material specifications and construction techniques.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination is plausible regarding specialized equipment sharing, contractor mobilization, and transmission outage sequencing given the 26.33 km distance, but significant uncertainty remains due to the unconfirmed schedule for the Effingham County project.

RECOMMENDED NEXT STEP

Utility planners should schedule a joint coordination meeting to review the anticipated construction timeline for the Effingham County project and evaluate potential outage coordination prior to December 2026.
