

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Effingham County 500 kV

Distance between closest known points: 23.38 km

Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

PROJECTS

- Project A: Effingham County 500 kV (utility company not specified in the supplied data).
- Project B: Riverport 115kV Tap: Construct Tap (utility company not specified in the supplied data).

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged based on geographic proximity. The closest known points of the two projects are 23.38 km apart, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At a distance of 23.38 km, the projects sit in neighboring border counties across the Georgia and South Carolina state line (Effingham County and Jasper County). This distance is too great for shared right-of-way, access roads, or daily laydown yards. However, the projects are close enough to allow regional coordination. If the utilities cooperate, they may be able to share regional transmission construction crews, specialized heavy equipment, and cross-border grid outage planning.

TIMELINE ANALYSIS

- Project A is listed in the Planning phase, with no start or end dates provided.
- Project B is listed as In Progress, with a scheduled end date of December 1, 2026, and an unlisted start date.

Timeline compatibility cannot be fully confirmed because schedule data for Project A is missing. If Project A moves into construction prior to December 2026, the construction schedules could potentially overlap.

COORDINATION OPPORTUNITIES

- Shared contractors: The projects could potentially engage the same regional high-voltage transmission contractors.
- Specialized equipment: If specialized stringing, tensioning, or crane equipment is required, utilities may be able to coordinate shared mobilization between the two sites.

- Mobilization efficiency: Staggered or aligned scheduling could potentially lower contractor mobilization costs across the regional area.
- Outage timing: Grid operators could potentially coordinate transmission outages to preserve regional grid stability during construction and tie-in activities.

POTENTIAL BENEFITS

- Qualitative cost savings from reduced duplicate mobilization of specialized high-voltage line crews and machinery.
- Enhanced regional electric reliability through coordinated outage sequencing.
- Potential efficiency gains from regional contractor familiarity with local terrain and logistics.

RISKS AND LIMITATIONS

- The projects are situated in different states (Georgia and South Carolina), which may involve different utilities, regional transmission organizations, and regulatory requirements.
- Project A is only in planning while Project B is already in progress, creating the risk that Project B will finish before Project A begins construction.
- The company names, estimated cost for Project A, and start dates for both projects are missing from the supplied records.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible because both assets involve high-voltage transmission work within a 24 km regional radius; however, important uncertainty remains regarding Project A's timeline, actual schedule overlap, and cross-state utility alignment.

RECOMMENDED NEXT STEP

Utility planners should make direct contact to determine Project A's target construction schedule and evaluate whether high-voltage transmission resources or outage windows can be aligned before Project B concludes in December 2026.
