

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road Substation

Distance between closest known points: 27.87 km

Dominion Energy South Carolina

Hooks - Modoc 115/46 kV Rebuild

PROJECTS

- Project A: Callaway Road Substation, located in Columbia County, Georgia. The operating company is not specified in the provided data.
- Project B: Hooks - Modoc 115/46 kV Rebuild, located in McCormick County, South Carolina. The operating company is not specified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged because the closest known points are separated by 27.87 km, placing them in the under-40-km regional proximity category.

GEOGRAPHIC ANALYSIS

At a distance of 27.87 km across the Georgia-South Carolina regional border, the sites are too far apart to share physical right-of-way, local access roads, or daily staging facilities. However, being under 40 km apart, the projects are close enough to allow regional utility coordination, such as shared contractor networks, regional equipment mobilization, and high-level construction scheduling.

TIMELINE ANALYSIS

- Project A lists a start date of Spring 2027, with no completion date specified.
- Project B lists a target completion date of December 31, 2027, with no start date specified.

Both projects reference activity during calendar year 2027, suggesting plausible overlap during that year. However, because both schedules have missing start or end dates, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

If construction schedules coincide during 2027, the projects could potentially explore:

- Shared regional contractors or trade crews with expertise in high-voltage utility construction.

- Coordinated mobilization of specialized heavy equipment, such as heavy-haul transport or large cranes, if needed by both sites.
- Joint regional scheduling to prevent local resource competition and minimize freight mobilization costs.
- Coordinated transmission outage timing and grid operations planning within the regional balancing area.

POTENTIAL BENEFITS

- Reduced regional mobilization and demobilization expenses for shared contractor teams or heavy equipment.
- Improved workforce availability through synchronized regional labor deployment.
- Minimized grid reliability risks through coordinated regional transmission outage scheduling.

RISKS AND LIMITATIONS

- Incomplete schedule data creates uncertainty regarding whether on-site construction windows will actually coincide in 2027.
- The projects involve different work scopes (new 500/230 kV substation build versus 6.5-mile 115/46 kV line rebuild), which may require distinct specialized equipment and crew skill sets.
- The projects cross state lines (Georgia and South Carolina), which could involve different operating companies, jurisdictions, and permitting requirements.
- Cost and schedule data are missing for Project A, limiting economic evaluation.

FINAL ASSESSMENT

MEDIUM

Meaningful regional coordination appears plausible given the 27.87 km distance and probable 2027 construction activity, but important uncertainties remain regarding schedule alignment, different construction types, and separate state jurisdictions.

RECOMMENDED NEXT STEP

Utility project managers should hold a joint planning meeting to share detailed 2027 schedule milestones and identify whether mutual contractor mobilization or regional outage coordination is feasible.
