

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Callaway Road Substation

Distance between closest known points: 35.19 km

Dominion Energy South Carolina

Stevens Creek - Graniteville 115 kV: Rebuild

PROJECTS

- Project A: Callaway Road Substation (operating utility company not specified in the records).
- Project B: Stevens Creek - Graniteville 115 kV: Rebuild (operating utility company not specified in the records).

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged because the closest known points are 35.19 km apart, placing them within the under 40 km regional coordination threshold.

GEOGRAPHIC ANALYSIS

At 35.19 km apart, the sites span Columbia County, Georgia and Edgefield County, South Carolina. This distance is too far for shared access roads, adjacent rights-of-way, or combined laydown yards. However, the under 40 km separation is close enough that the utilities may be able to coordinate regional mobilization, specialized heavy equipment, and regional construction contracting.

TIMELINE ANALYSIS

Project A has a planned start date of Spring 2027 with no reported completion date. Project B has a targeted completion date of December 31, 2029, with no reported start date. While both projects appear active in the late 2020s construction window, timeline compatibility cannot be fully confirmed due to the missing schedule details on both sides.

COORDINATION OPPORTUNITIES

Although Project A is a new 500/230 kV substation and Project B is a 15-mile 115 kV line rebuild, potential coordination options include:

- Shared specialized contractors: Utilities could potentially solicit bids from the same regional transmission and high-voltage electrical contractors.
- Shared heavy equipment: If specialized cranes or heavy civil equipment are required, utilities may be able to sequence usage to minimize transport overhead.

- Mobilization coordination: Contractors could potentially coordinate staging and crew travel across the neighboring Georgia-South Carolina regional corridor.
- Regional construction scheduling: Planners could coordinate regional system outage windows to ensure transmission stability during work.

POTENTIAL BENEFITS

- Potential reduction in contractor mobilization and demobilization expenses.
- Potential efficiencies in equipment rental periods through sequential scheduling.
- Improved regional visibility into workforce demand and power system outage timing.

RISKS AND LIMITATIONS

- The 35.19 km separation precludes direct site logistics, shared staging yards, or shared access roads.
- Work scopes differ, as one is substation construction and the other is a transmission line rebuild.
- The projects reside in different states (Georgia and South Carolina), which may involve different regulatory requirements.
- Incomplete schedule data leaves the actual degree of active construction overlap unconfirmed.
- Specific operating companies are not identified in the provided data.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible through shared regional contractors, specialized equipment, and coordinated mobilization within the 35.19 km radius. However, significant uncertainty remains due to incomplete schedule data, differing construction types, and separate state jurisdictions.

RECOMMENDED NEXT STEP

Utility planners should establish contact to share detailed project schedules and assess whether regional contractor procurement and equipment mobilization can be aligned for the 2027 to 2029 timeframe.
