Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 34.19 km

Dominion Energy South Carolina

Atomic Road 115/12kV Sub: Construct

PROJECTS

Project A: Plant Vogtle Units 1 and 2 Extended Power Uprates, Georgia Power.

Project B: Atomic Road 115/12kV Sub: Construct, utility operating in South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged based on geographic proximity. The closest known points are 34.19 km apart, placing them in the under 40 km coordination category.

GEOGRAPHIC ANALYSIS

At 34.19 km apart and separated by a state line (Georgia and South Carolina), the projects are too far apart to share access roads, laydown yards, or right-of-way. However, being within 40 km, the projects are within a distance where utilities could potentially share regional contractors, heavy equipment mobilization, or high-voltage testing resources.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed. Project A provides no start or completion dates. Project B is planned with an estimated completion date of December 31, 2028, but lists no start date. Because schedule data is incomplete for both projects, overlapping construction windows remain uncertain.

COORDINATION OPPORTUNITIES

If construction schedules overlap, potential coordination could include:

- Shared regional contractors: Electrical contractors operating in the Augusta-Aiken regional market could potentially serve both sites.
- Coordinated equipment mobilization: Heavy transport equipment, cranes, or specialized electrical testing gear could potentially be sequenced between sites to reduce regional mobilization expenses.
- Regional planning: Outage planning and transmission grid operations may be coordinated regionally to manage grid stability during cutovers or testing.

POTENTIAL BENEFITS

- Reduced mobilization expenses if shared heavy equipment or specialized contractors can be sequenced across both sites.
- Greater regional construction awareness, minimizing labor or equipment competition in the local Augusta area.

RISKS AND LIMITATIONS

- Incompatible project scopes: Nuclear power plant uprates involve specialized nuclear safety compliance, security clearances, and specialized nuclear contractors, whereas Project B is a standard 115/12kV distribution substation.
- Geographic distance: At 34.19 km, daily site sharing, shared laydown yards, or shared access roads are not viable.
- Jurisdictional differences: Project A is in Burke County, Georgia, while Project B is in Aiken County, South Carolina, involving different regulatory and utility frameworks.
- Data gaps: Project A lacks cost and schedule details, and Project B lacks start date information.

FINAL ASSESSMENT

LOW

Coordination potential is low. Although the projects are 34.19 km apart, they involve substantially different construction scopes (nuclear plant modifications versus a standard distribution substation) across two different states. Furthermore, schedule overlap cannot be verified due to missing dates. Any cooperation would likely be limited to indirect regional contractor availability or mobilization planning.

RECOMMENDED NEXT STEP

Utility planners should exchange high-level construction milestone schedules to determine whether common high-voltage electrical contractors or testing equipment could be utilized during overlapping timeframes.
