

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Effingham County Substation

Distance between closest known points: 26.33 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

- Project A: Effingham County Substation, located in Effingham County, Georgia. The operating company is not specified in the provided data.
- Project B: Jasper - Okatie 230 kV #2: Construct, located in Jasper County, South Carolina. The operating company is not specified in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because the closest known points are separated by 26.33 km, placing them in the under 40 km distance category.

GEOGRAPHIC ANALYSIS

At a distance of 26.33 km across the Georgia-South Carolina state line, the projects are too far apart for direct site sharing, shared access roads, or joint laydown areas. However, this regional separation is within a range that could potentially allow utilities to share specialized contractors, high-voltage equipment, or regional labor pools if project activities align.

TIMELINE ANALYSIS

- Project A has a planned start date of Fall 2027, with no completion date specified. Its status is Planning.
- Project B has an end date of December 1, 2026, with no start date specified. Its status is In Progress.

Timeline compatibility cannot be fully confirmed due to missing start and end dates. Based on the available data, Project B is scheduled to conclude in late 2026, roughly nine months before Project A begins in Fall 2027. Unless Project B experiences delays or Project A mobilizes early, direct schedule overlap appears unlikely.

COORDINATION OPPORTUNITIES

If timelines shift or regional coordination is pursued, potential opportunities include:

- Sequential contractor or crew transition: Specialized electrical contractors finishing work on Project B could potentially transition to Project A.

- Specialized equipment sharing: Heavy transport or specialized tensioning and lifting machinery could potentially be retained regionally rather than demobilized out of the area.
- Regional procurement insights: Teams could potentially share supplier availability data for common 230 kV hardware and materials.

POTENTIAL BENEFITS

- Reduced mobilization costs if contractors or regional resources can move sequentially from one project to the next.
- Improved resource planning for regional transmission contractors operating in the Georgia-South Carolina border corridor.

RISKS AND LIMITATIONS

- Schedule mismatch: The current schedule indicates Project B finishes before Project A starts, preventing simultaneous resource sharing.
- Cross-border jurisdiction: The projects are in different states (Georgia and South Carolina) and may involve different operating utilities, regulatory jurisdictions, or permitting processes.
- Incomplete data: Missing end date for Project A, missing start date for Project B, and unknown operating entities limit detailed evaluation.

FINAL ASSESSMENT

LOW

Explanation: While the projects are 26.33 km apart, the available dates show no overlap, with Project B scheduled to finish in December 2026 and Project A not starting until Fall 2027. Coordination would be limited primarily to sequential contractor handoffs or regional scheduling if dates shift.

RECOMMENDED NEXT STEP

Utility project managers should hold a brief regional planning call to review current schedule milestones and identify whether Project B delays or Project A early site preparations create sequential contractor mobilization opportunities.
