

GRIDALIGN

Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 37.37 km

Dominion Energy South Carolina

Urquhart - Aiken PSA 46 kV: Rebuild

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, Burke County, Georgia.
- Project B: Urquhart - Aiken PSA 46 kV: Rebuild, Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair based on geographic proximity. The closest known points of the two projects are 37.37 km apart, placing them within the under 40 km regional coordination category.

GEOGRAPHIC ANALYSIS

At a distance of 37.37 km across the Georgia and South Carolina state border, these sites are too distant to share physical work areas, right-of-way, or laydown yards. However, the under 40 km radius indicates that the projects may still be close enough to participate in regional construction planning, regional contractor engagement, and coordinated logistics across the regional utility corridor.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed due to missing schedule data. Project A is listed as approved, but no start date or completion date is provided. Project B is planned with an estimated completion date of December 31, 2027, but lacks a start date. It is unknown whether physical construction activities will overlap.

COORDINATION OPPORTUNITIES

Because the project types differ significantly, direct on-site cooperation is limited, but the utilities could potentially explore:

- Shared regional contractors: The utilities may be able to engage the same high-voltage electrical engineering or construction firms if specialized work scopes align.
- Specialized equipment mobilization: If heavy-lift cranes or heavy transport equipment are required for both sites, the project teams could potentially coordinate sequential mobilization to reduce overall shipping costs.

- Regional grid and outage planning: Regional planners may be able to align scheduled outages to prevent conflicting constraints between generation testing and transmission line work.

POTENTIAL BENEFITS

- Potential cost savings from coordinated mobilization of specialized regional contractors or equipment.
- Improved regional visibility into utility construction traffic and electrical outages.
- Reduced competition for regional specialty craft labor if schedules are harmonized.

RISKS AND LIMITATIONS

- Incompatible scopes: Project A is a nuclear plant generation uprate with strict nuclear security, regulatory, and quality requirements, while Project B is a standard 46 kV transmission line rebuild.
- Cross-state boundary: The projects operate in separate states (Georgia and South Carolina) and potentially separate utility jurisdictions.
- Schedule uncertainty: The lack of a defined start date for Project B and the absence of all schedule dates for Project A make timeline alignment speculative.
- Distance limits practical daily sharing of staging areas, access roads, or standard field crews.

FINAL ASSESSMENT

LOW

While the projects satisfy the geographic filter at 37.37 km, the specialized nature of nuclear generation upgrades compared to a 46 kV transmission rebuild, combined with major schedule gaps, restricts potential coordination to high-level regional planning and contractor mobilization.

RECOMMENDED NEXT STEP

Utility project managers should hold an initial briefing to share tentative construction windows and determine if overlapping contractor mobilizations exist before 2028.
