Coordination Opportunity Report

Georgia Power

Plant Vogtle Units 1 & 2 Extended Power Uprates

Distance between closest known points: 20.83 km

Dominion Energy South Carolina

Jackson 115kV: Construct 115 - 12kV Distribution Substation

PROJECTS

- Project A: Plant Vogtle Units 1 & 2 Extended Power Uprates, Georgia Power / Georgia Public Service Commission, located in Burke County, Georgia.
- Project B: Jackson 115kV: Construct 115 - 12kV Distribution Substation, located in Aiken County, South Carolina.

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged because the closest known points between the two project locations are 20.83 km apart, placing them within GridAlign's under 40 km coordination threshold.

GEOGRAPHIC ANALYSIS

At a distance of 20.83 km across the Georgia-South Carolina border, the project sites are too far apart to share immediate work zones, rights-of-way, or physical laydown yards. However, being under 40 km apart, the projects fall within a range that could potentially allow regional construction planning, shared mobilization of specialty contractors, or coordinated regional heavy transport routes.

TIMELINE ANALYSIS

Timeline compatibility cannot be fully confirmed with the provided data. Project B has a planned completion date of December 31, 2028, but no listed start date. Project A has no specified start or end dates. Because active construction windows are unconfirmed, it is unknown whether the physical work will take place concurrently.

COORDINATION OPPORTUNITIES

If the construction schedules overlap, potential coordination opportunities may include:

- Shared regional electrical contractors or mobilization efforts.
- Shared specialized testing, commissioning, or high-voltage equipment, if technically compatible.
- Coordinated scheduling of heavy equipment deliveries or specialty transport along shared regional transit corridors.

- Regional transmission and distribution outage planning to avoid concurrent system constraints.

POTENTIAL BENEFITS

Coordination could potentially lower mobilization and demobilization expenses for contractors operating in the Central Savannah River area. Aligning equipment delivery schedules or specialized testing services could also improve regional resource efficiency and reduce logistical redundancies.

RISKS AND LIMITATIONS

- Scope mismatch: Project A is a major nuclear power uprate requiring nuclear-grade regulatory compliance, specialized security clearances, and specific procedures, whereas Project B is a standard distribution substation replacement.
- Jurisdictional division: The projects are located in different states (Georgia and South Carolina) and are managed under different utility frameworks.
- Missing data: Project A lacks timeline and cost details, and Project B lacks start dates, leaving schedule overlap entirely unverified.

FINAL ASSESSMENT

LOW

While the projects are approximately 21 km apart, they involve fundamentally different work environments—a nuclear generation uprate versus a small distribution substation—across different state jurisdictions. Given the distinct technical requirements, regulatory boundaries, and significant schedule uncertainties, only limited or indirect regional coordination appears plausible.

RECOMMENDED NEXT STEP

The project managers should exchange projected construction milestone dates to determine if any major electrical or heavy transport phases overlap prior to 2028.
