Coordination Opportunity Report

Georgia Power

Plant McIntosh Natural Gas Upgrades

Distance between closest known points: 11.53 km

Dominion Energy South Carolina

Jasper - Okatie 230 kV #2: Construct

PROJECTS

- Project A: Plant McIntosh Natural Gas Upgrades, associated with Georgia Power and the Georgia Public Service Commission.
- Project B: Jasper - Okatie 230 kV #2: Construct, operating entity not explicitly named in the provided data.

WHY GRIDALIGN FLAGGED THIS PAIR

This pair was flagged because the closest known points between the two projects are separated by 11.53 km, placing them within GridAlign's under 40 km regional coordination category.

GEOGRAPHIC ANALYSIS

The projects are located 11.53 km apart, spanning the Georgia-South Carolina border region between Rincon, Georgia, and Jasper County, South Carolina. Under GridAlign distance criteria for projects under 40 km, this distance is sufficiently close to explore shared regional contractor mobilization, shared specialized heavy equipment, and cross-border regional construction planning.

TIMELINE ANALYSIS

- Project A has no start date or end date provided, although its status is listed as Approved.
- Project B has an In Progress status with an end date of December 1, 2026, but its start date is not specified.

Because Project A provides no schedule details, timeline compatibility cannot be fully confirmed.

COORDINATION OPPORTUNITIES

Despite the differing project types (a 268 MW natural gas generation expansion versus a 6.5-mile 230 kV transmission line and substation CIP hut addition), the projects could explore cooperation in several areas:

- Shared specialized equipment, such as heavy-duty mobile cranes or foundation equipment, if these resources are required at both sites during similar timeframes.
- Shared high-voltage electrical or civil contractors, if contractors can be mobilized under regional service agreements to serve both the power plant and transmission line.

- Outage timing coordination, if tying in the 268 MW generation capacity and energizing the new 230 kV line require planned outages on interconnected regional transmission facilities.
- Coordinated deliveries, if heavy equipment transport or bulk materials share common highway corridors between Georgia and South Carolina.

POTENTIAL BENEFITS

- Reduced mobilization expenses if specialized machinery or contractor crews can be shared across the 11.53 km distance.
- Minimized grid disruption through synchronized high-voltage outage planning.
- Improved logistics and reduced regional road impact through coordinated heavy-haul transport.

RISKS AND LIMITATIONS

- Schedule compatibility is completely unverified due to the missing milestone dates for Plant McIntosh.
- The projects operate in different states (Georgia and South Carolina), which may introduce separate regulatory frameworks, utility owners, and procurement structures.
- Different construction scopes-power generation upgrades versus linear overhead line construction-may require distinct technical labor and limit direct workforce interchangeability.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible for specialized equipment mobilization, regional contractor utilization, and transmission outage sequencing given the 11.53 km separation, but important uncertainty remains due to the missing schedule for Project A and different operating jurisdictions.

RECOMMENDED NEXT STEP

Project managers should meet to share schedule milestones and determine whether construction activities at Plant McIntosh will take place prior to the Jasper - Okatie completion date of December 2026.
