Coordination Opportunity Report

Georgia Power

Plant McIntosh Natural Gas Upgrades

Distance between closest known points: 11.03 km

Dominion Energy South Carolina

Riverport 115kV Tap: Construct Tap

PROJECTS

- Project A: Plant McIntosh Natural Gas Upgrades, Georgia Power (identified via Georgia Public Service Commission filings).
- Project B: Riverport 115kV Tap: Construct Tap, utility company not explicitly named in the provided project data.

WHY GRIDALIGN FLAGGED THIS PAIR

The closest known points between these projects are separated by 11.03 km. This distance falls within GridAlign's under 40 km category, indicating potential opportunities for regional construction planning, shared specialized resources, and contractor mobilization.

GEOGRAPHIC ANALYSIS

Separated by 11.03 km across the Georgia-South Carolina border (Effingham County, Georgia to Jasper County, South Carolina), the two sites are too far apart to share physical rights-of-way, local access roads, or immediate site boundaries. However, this separation is well within the regional distance threshold where utilities may be able to share regional contractor pools, coordinate heavy-haul logistics, or utilize common freight transport corridors across the Savannah River region.

TIMELINE ANALYSIS

- Project A status is Approved, but its start date and completion date are not reported.
- Project B status is In Progress, with a scheduled completion date of December 1, 2026.

Because Project A lacks explicit schedule dates, timeline compatibility cannot be fully confirmed. If Project A advances to construction prior to December 2026, active construction windows could potentially overlap.

COORDINATION OPPORTUNITIES

- Shared specialized equipment: If heavy cranes, pile-driving equipment, or heavy-haul transport vehicles are required, mobilization could potentially be coordinated or sequenced between both sites.

- Regional contractor sharing: The project teams could potentially engage the same regional civil, electrical, or high-voltage transmission contractors to reduce regional bidding competition.
- Staging and laydown coordination: If off-site logistics hubs are needed, shared staging yards near regional highways could potentially support material deliveries for both jobs.
- Regional operational planning: Planners could potentially coordinate the electrical system integration of the 268 MW expansion with the new transmission tap construction to support regional grid reliability.

POTENTIAL BENEFITS

- Reduced duplicate mobilization expenses if shared specialized equipment can be sequenced across both sites.
- Improved resource availability by coordinating contractor demand across the regional labor market.
- Lower regional logistics burden through coordinated freight delivery schedules.

RISKS AND LIMITATIONS

- Incomplete schedule data for Project A prevents confirmation of overlapping construction activities.
- The projects cross state lines and involve different regulatory frameworks.
- Differences in project type (power plant capacity expansion versus transmission tap construction) may limit direct trade crew overlap.
- Missing budget data for Project A leaves financial scope comparisons uncertain.

FINAL ASSESSMENT

MEDIUM

Meaningful coordination appears plausible through regional contractor alignment and shared equipment mobilization across this 11.03 km distance, but important uncertainty remains regarding Project A's construction schedule and cross-utility cooperation.

RECOMMENDED NEXT STEP

Utility planners should contact the Project A management team to confirm target construction dates and determine whether joint contractor sourcing or heavy equipment mobilization with Project B is feasible before late 2026.
