Coordination Opportunity Report

Georgia Power

Callaway Road - Thomson Primary 500 kV

Distance between closest known points: 34.16 km

Dominion Energy South Carolina

Urquhart - Toolebeck 115kV line: Rebuild

PROJECTS

- Project A: Callaway Road - Thomson Primary 500 kV, an area transmission line and substation project in Georgia (utility company not identified in source).
- Project B: Urquhart - Toolebeck 115kV line: Rebuild, a transmission line rebuild project in South Carolina (utility company not identified in source).

WHY GRIDALIGN FLAGGED THIS PAIR

GridAlign flagged this pair because their closest known points are 34.16 km apart, placing them within the under 40 km regional coordination category.

GEOGRAPHIC ANALYSIS

At 34.16 km apart across the Georgia and South Carolina state border, direct physical interaction, shared rights-of-way, or combined laydown yards are unlikely. However, this distance is close enough that regional construction planning, specialized transmission contractors, or regional heavy equipment could potentially be coordinated across the area if logistics permit.

TIMELINE ANALYSIS

Schedule compatibility cannot be fully confirmed, and the available dates indicate no direct construction overlap:

- Project A is in planning with a stated start date of Summer 2027 and an unspecified end date.
- Project B is in progress with an estimated completion date of August 12, 2026, and an unspecified start date.

Unless Project B faces schedule delays or Project A begins early site development, an approximate one-year gap exists between Project B concluding and Project A commencing.

COORDINATION OPPORTUNITIES

- Sequential contractor transition: Regional transmission contractors finishing Project B in late 2026 could potentially be engaged for work on Project A in 2027.

- Equipment demobilization and mobilization: Heavy line construction equipment or specialized pulling gear may be able to transition regionally if schedules shift.
- Regional workforce planning: Utility planners may be able to coordinate skilled transmission labor availability across the regional corridor.

POTENTIAL BENEFITS

- Potential reduction in contractor remobilization expenses if construction dates shift closer together.
- Improved regional visibility for transmission line labor and specialized equipment sourcing.

RISKS AND LIMITATIONS

- Direct schedule overlap is lacking based on the August 2026 completion for Project B and the Summer 2027 start for Project A.
- The projects involve different voltage classes (500 kV new build with substation versus 115 kV line rebuild), which may require different structural components and equipment.
- Projects are in different states (Georgia and South Carolina), which may involve separate regulatory frameworks.
- Specific utility companies are not named in the source data.

FINAL ASSESSMENT

LOW

While the projects are within regional proximity (34.16 km), Project B is scheduled to finish nearly a year before Project A begins, and the work involves distinct voltage classes across state lines. Coordination appears limited to indirect opportunities such as sequential contractor mobilization if project timelines shift.

RECOMMENDED NEXT STEP

Utility planners should hold an initial schedule check to confirm whether Project B's completion timeline or Project A's early pre-construction activities might shift enough to create direct resource overlap.
